Preface

$Revision: 1.14 $
$Date: 2004/10/10 21:10:08 $

The Common Component Architecture (CCA) is an environment for component-based software engineering (CBSE) specifically designed to meet the needs of high-performance scientific computing. It has been developed by members of the Common Component Architecture Forum [http://www.cca-forum.org].

This document is intended to guide the reader through a series of increasingly complex tasks starting from composing and running a simple scientific application using pre-installed CCA components and tools, to writing (simple) components of your own. It was originally designed and used to guide the "hands-on" portion of the CCA tutorial, but we hope that it will be useful for self-study as well.

We assume that you've had an introduction to the terminology and concepts of CBSE and the CCA in particular. If not, we recommend you peruse a recent version of the CCA tutorial [http://www.cca-forum.org/tutorials/] presentations before undertaking to complete the tasks in this Guide.

1. Help us Improve this Guide

If you find errors in this document, or have trouble understanding any portion of it, please let us know so that we can improve the next release. Email us at `<tutorial-wg@cca-forum.org>` with your comments and questions.

2. Finding the Latest Version of the CCA Hands-On Exercises

The hands-on exercises and this Guide are evolving and improving. We will maintain links to the current releases of this Guide, the tutorial code, and accompanying tools at http://www.cca-forum.org/tutorials/#sources. If you want older versions or intermediate "release candidates", follow the links there to the parent download directories to see the full list of available files.

3. Typographic Conventions

- `This font` is used for file and directory names.
- **This font** is used for commands.
- **`This font`** is used for input the user is expected to enter.
- *`This font`* is used for "replaceable" text or variables. Replaceable text is text that describes something you're supposed to type, like a *`filename`*, in which the word "filename" is a placeholder for the actual filename.
- The following fonts are used to denote various programming constructs: `class names` (CCA "components"), `interface names` (CCA "ports"), and `method names`. Also `variable names` and `environment variables` are marked up with special fonts.
- URLs [http://www.cca-forum.org/] are presented in square brackets after the name of the resource they describe in the print version of this Guide.

- Sometime we must break lines in computer output or program listings to fit the line widths available. In these cases, the break will be marked by a "\" character. In real computer output, you a long continuous line rather than a broken one. For program listings, unless otherwise indicated, you can join up the broken lines. In shell commands, you can use the "\" and break the input over multiple lines.

4. File and Directory Naming Conventions

Throughout this Guide, we refer to various files and directories, the precise location of which depends on how and where things were built and installed. All such references will be based on a few key directory locations, which will be determined when you build and install the software (Appendix B, *Building the CCA Tools and TAU, and Setting Up Your Environment* and Appendix C, *Building the Tutorial and Student Code Trees*). If you're participating in an organized tutorial, your account information sheet will indicate the particular locations of each directory for the machine you'll be using.

`CCA_TOOLS_ROOT`	The installation location of the CCA tools. (See Section B.1, "The CCA Tools".)
`TAU_ROOT`	The installation location of the TAU Portable Profiling package. (See Section B.3, "Downloading and Installing TAU".)
`TAU_CMPT_ROOT`	The installation location of the TAU performance component. (See Section B.3, "Downloading and Installing TAU".)
`tutorial-src`	The location that the `tutorial-src-`*`version`*`.tar.gz` file was unpacked and built. (See Appendix C, *Building the Tutorial and Student Code Trees*.)
`student-src`	The location that the `student-src-`*`version`*`.tar.gz` file was unpacked and built. (See Appendix C, *Building the Tutorial and Student Code Trees*.)

5. Acknowledgments

There are quite a few people active in the Tutorial Working Group who have contributed to the general development of the CCA tutorial and this Guide in particular:

People	Rob Armstrong, David Bernholdt (chair), Randy Bramley, Lori Freitag Diachin, Wael Elwasif, Madhusudhan Govindaraju, Ragib Hasan, Dan Katz, Jim Kohl, Gary Kumfert, Lois Curfman McInnes, Boyana Norris, Craig Rasmussen, Jaideep Ray, Sameer Shende, Torsten Wilde, Shujia Zhou
Institutions	Argonne National Laboratory, Binghamton University - State University of New York, Indiana University, Jet Propulsion Laboratory, Los Alamos National Laboratory, Lawrence Livermore National Laboratory, NASA/Goddard, University of Illinois, Oak Ridge National Laboratory, Sandia National Laboratories, University of Oregon

Computer facilities for the hands-on exercise in this tutorial have been provided by the Computer Science Department and University Information Technology Services of Indiana University, supported in part by NSF Grants CDA-9601632 and EIA-0202048.

Finally, we must acknowledge the efforts of the numerous additional people who have worked very hard to make the Common Component Architecture what it is today. Without them, we wouldn't have anything to present tutorials about!

Chapter 1. Introduction

$Revision: 1.22 $
$Date: 2004/10/10 14:47:36 $

In this Guide, we will take you step by step through a series of hands-on tasks with CCA components in the CCA software environment. We've intentionally chosen a very simple example from a scientific viewpoint, numerical integration in one dimension, so that we can focus on the issues of the component environment. It may look like overkill to have broken down such a simple task into multiple components, but once you have a basic understanding of how to use and create components, you should be able to extend the concepts to components that are scientifically interesting to you and far more complex.

In this integration example, which you've probably already seen mentioned in the tutorial presentations, we have:

- driver components, which are used like the `main` routine in a traditional program to orchestrate the overall calculation;
- a number of integrator components implementing different integration algorithms; and
- a selection of function components that can be integrated.

The exercises are laid out as follows:

- In Chapter 2, *Assembling and Running a CCA Application*, you will use pre-built components to assemble and run several different numerical integration applications.
- In Chapter 3, *Sewing CCA Components into an Application: the Driver Component*, you will construct your own driver component.
- In Chapter 4, *Creating a Component from an Existing Library*, you will wrap up an existing Fortran90 library as an integrator component.
- In Chapter 5, *Creating a New Component from Scratch*, you will create a new function component from scratch.

In Chapter 2, *Assembling and Running a CCA Application*, you'll be working with a complete version of the tutorial code tree. Then in Chapter 3, *Sewing CCA Components into an Application: the Driver Component* and the subsequent exercises, you'll start from your own copy of a separate stripped-down "student" version of the tutorial code tree and build up to the complete set of components as you work through the exercises. In this way, the separate complete tutorial code tree can always serve as a reference if you run into problems. Of course if you're working through this Guide as part of an organized tutorial, there should be instructors around who can help you. And if you're working on your own, you can email us for help at `<tutorial-wg@cca-forum.org>`.

1.1. The CCA Software Environment

The CCA is, at its heart, just a specification. There are several realizations of the CCA as a software environment. In this Guide, we use the following tools to provide that software environment, which are currently the most widely used for high-performance (as opposed to distributed) computing using the CCA:

Ccaffeine — A CCA framework which emphasizes local and parallel high-performance computing, and currently the predominate CCA framework in real applications. For more information, see http://www.cca-forum.org/ccafe/.

Babel — A tool for language interoperability. It allows components written in different languages to be connected together. The Scientific Interface Definition Language (SIDL) is associated with Babel. For more information, see ht-

tp://www.llnl.gov/CASC/components/babel.html.

Many of the commands you will type are specific to the fact that you're using these tools as your CCA software environment. But the components you will use and create are independent of the particular tools being used.

1.2. Where to Go from Here

Before starting the exercises, you'll need to do a little bit of work to set things up. Depending on whether you're working through the Guide on your own or participating in an organized tutorial, this may include getting logged in to a remote system, preparing the CCA environment, and building the tutorial code needed for Chapter 2, *Assembling and Running a CCA Application*.

1. **Getting Connected**

   a. **Organized Tutorial Participant**

      If you're participating in an organized tutorial, you'll probably be using a remote system that's already setup with nearly all of the software you need. You'll be given details for your account, your machine assignment, etc. by the tutorial instructors. That info, together with the notes in Appendix A, *Remote Access for the CCA Environment* should give you sufficient information to get logged in to the remote machine. If you have any problems, ask the tutorial instructors.

   b. **Self-Study User**

      If you're working through the Guide on your own, you may choose to work locally or remotely, depending on the resources you have available. If you're working remotely, you may want to refer to the notes on using the CCA tools remotely in Appendix A, *Remote Access for the CCA Environment*.

2. **Preparing the CCA Environment**

   a. **Organized Tutorial Participant**

      In this case, the CCA tools (Ccaffeine and Babel) will already have been built in a common area. You will have to do is insure that your login environment is properly setup to access those tools. This generally involves adding some directories to your `PATH` and setting some other environment variables. Instructions will be included with your account information. Some general notes can be found in Section B.4, “Setting Up Your Login Environment”. If you wish to use the Ccaffeine GUI, you will also need to download it and set it up on your local system. Instructions can be found in Section B.2, “The Ccaffeine GUI”.

   b. **Self-Study User**

      In this case, you will need to download and install the CCA tools (Ccaffeine and Babel) and configure your login environment to use them. Instructions can be found in Appendix B, *Building the CCA Tools and TAU, and Setting Up Your Environment*. If you wish to use the Ccaffeine GUI and you are working on a remote machine, you will need to download the GUI and set it up on your local system. Instructions can be found in Section B.2, “The Ccaffeine GUI”.

3. **Building the Tutorial Code**

   a. **Organized Tutorial Participant**

      Once again, the tutorial code will already have been built in a central location. (Though later on, you'll have to build your own copy of the student code tree, so you don't completely escape the work.)

   b. **Self-Study User**

      You'll also need to download and build the tutorial code tree, and later the student code tree. Instructions can be found in Appendix C, *Building the Tutorial and Student Code Trees*.

Once you've setup everything as outlined above, you should be ready to proceed to Chapter 2, *Assembling and Running a CCA Application*.

Chapter 2. Assembling and Running a CCA Application

$Revision: 1.29 $
$Date: 2004/11/07 16:38:03 $

In this exercise, you will work with pre-built components from the integrator example to compose several CCA-based applications and execute them. The components available are:

Drivers:	`drivers.CXXDriver*`, `drivers.F90Driver*`, `drivers.PYDriver`
Integrators:	`integrators.MonteCarlo`, `integrators.Midpoint*`, `integrators.Trapezoid`
Functions:	`functions.PiFunction` ($4/(1+x^2)$, which integrates to pi), `functions.CubeFunction*` (x^3, which integrates to 0.25), `functions.LinearFunction` (x, which integrates to 0.5)
Random Number Generators:	`randomgens.RandNumGenerator` (required by `integrators.MonteCarlo`)

Components marked with a "*" are ones that you will be creating in the subsequent exercises (you only need to do one of the two driver components), but as we have mentioned, the pre-built tree include completed examples of *all* of the components.

Below are three different procedures for this exercise. In Section 2.1, "A CCA Application in Detail", you interact directly with Ccaffeine on the command line to do everything. This is the best place to start to understand how to assemble and run a CCA application. In Section 2.2, " Running Ccaffeine Using an rc File ", you will see how the steps you performed manually in the first procedure can be captured in a script that Ccaffeine reads. This is the more common scenario because it gives you an easy way to represent a complete CCA application that is easy to reproduce, or to adapt to other situations, without having to re-do everything from scratch every time you want to run it. This is probably the approach you'll want to use when testing your work in the subsequent exercises. Finally, in Section 2.3, "Using the GUI Front-End to Ccaffeine", we use a graphical front-end to Ccaffeine, which allows you to perform the composition and execution of the application using a "visual programming" metaphor.

Note

This exercise uses the `tutorial-src` code tree. If you are participating in an organized tutorial, the tree will have been built for you in advance, and the location will be noted on your account information handout. If you're working through this exercise on your own, you'll need to build the code tree, following the instructions in Appendix C, *Building the Tutorial and Student Code Trees*.

Tip

These exercises can involve a fair amount of typing. You may find it convenient to use the online HTML version of this Guide (at http://www.cca-forum.org/tutorials/#sources to cut and paste the necessary inputs.

2.1. A CCA Application in Detail

In this section, you will interact directly with the Ccaffeine framework to assemble and run several different numerical integration applications from pre-built components.

We will present the procedure in the form of a dialog between you and the Ccaffeine framework. Things you are supposed to type are presented **`like this`** and Ccaffeine's output will be presented `like this`. Note that Ccaffeine's input prompt is "`cca>`". Particular features of the output will sometimes be marked and discussed in further detail below the output fragment.

Tip

The complete set of Ccaffeine commands for this procedure can be found in `tutorial-src/components/examples/task0_rc`. You can use this file for reference, or to cut and paste commands into Ccaffeine.

1. Start the Ccaffeine framework with the command **`ccafe-single`**. **ccafe-single** is one of several ways to invoke the Ccaffeine framework, and is used for single-process (i.e. sequential) interactive sessions; **ccafe-batch** is designed for use in non-interactive situations, including parallel jobs; and **ccafe-client** is designed to interact with a front-end GUI rather than with a user at the command line interface.

   Here is what you'll see (note that some of the output lines have been folded for presentation here, indicated by "\"):

```
(16251) CmdLineClientMain.cxx: MPI_Init not called in \          ❶
        ccafe-single mode.
(16251) CmdLineClientMain.cxx: Try running with ccafe-single \
        --ccafe-mpi yes , or
(16251) CmdLineClientMain.cxx: try setenv CCAFE_USE_MPI 1 to force MPI_Init.
(16251) my rank: -1, my pid: 16251
my rank: -1, my pid: 16251
my rank: -1, my pid: 16251
my rank: -1, my pid: 16251Type: One Processor Interactive         ❶

CCAFFEINE configured with babel.❷

cca>
CmdContextCCAMPI::initRC: No rc file found. Pallet may be empty.❸
```

   ❶ Lines between these two markers give information about the status of MPI in the Ccaffeine framework, including the processes rank if MPI is initialized. As the messages indicate, **ccafe-single** is intended for single-process use and does not normally call `MPI_Init`, but if you're running parallel and having problems with the MPI environment, this is the first place to look for signs of trouble.

   ❷ This message confirms that this Ccaffeine executable was configured and built to work with Babel. This is a useful thing to check when you're using an unfamiliar installation of Ccaffeine, or the first time you Ccaffeine after building it yourself.

   ❸ It is common to use an "`rc`" file with Ccaffeine to help assemble and run the application. This is the place where Ccaffeine confirms that it loaded the `rc` file you intended (or in this case, it confirms that we *didn't* specify one). If there is an `rc` file, the Ccaffeine output from the commands it contains will follow this message, so there may be a lot more text between this message and the "`cca>`" prompt at which you can interact with Ccaffeine.

Note

We present Ccaffeine's output with “spew” disabled (the default). If Ccaffeine is configured and built with the `--enable-spew` option, you will see a *lot* of debugging output from Ccaffeine itself in addition to what we show here.

2. Ccaffeine uses a “path” to determine where it should look for CCA components (specifically the `.cca` files, which internally point to the actual libraries that are needed). When it starts up, Ccaffeine's path is empty, and it has no idea where to find components. Next you will set the path that points to the pre-built components:

```
path
pathBegin
pathEnd! empty path.

cca>path set tutorial-src/components/lib (1)
# There are allegedly 8 classes in the component path

cca>path
pathBegin
pathElement tutorial-src/components/lib
pathEnd
```

(1) Remember that when you see markup like “*tutorial-src*” you should replace it with the appropriate directory location on the system you're using. If you're part of an organized tutorial, this will be on the handout you received.

Path-related commands in Ccaffeine include:

path append	Adds a directory to the end of the current path.
path init	Sets the path from the value of the `$CCA_COMPONENT_PATH` environment variable.
path prepend	Adds a directory to the beginning of the current path.
path set	Sets the path to the value provided.

Tip

Typing **help** at the Ccaffeine `cca>` prompt will provide a complete list of the commands Ccaffeine's scripting language understands.

3. Ccaffeine also has the concept of a *palette* of components from which applications can be assembled. The **palette** command will show you what is currently in the *palette*, and the **repository get-global *class_name*** command is used to get the component of the specified class name from the repository (path) and load it into the *palette*:

```
cca>palette
Components available:

cca>repository get-global drivers.CXXDriver
Loaded drivers.CXXDriver NOW  GLOBAL .

cca>repository get-global functions.PiFunction
```

```
Loaded functions.PiFunction NOW  GLOBAL .

cca>repository get-global integrators.MonteCarlo
Loaded integrators.MonteCarlo NOW  GLOBAL .

cca>repository get-global randomgens.RandNumGenerator
Loaded randomgens.RandNumGenerator NOW  GLOBAL .

cca>palette
Components available:
drivers.CXXDriver
functions.PiFunction
integrators.MonteCarlo
randomgens.RandNumGenerator
```

4. Next, you need to instantiate the components you're going to use. The **instances** command will list all the component instances in Ccaffeine's work area, or *arena*. The command **instantiate *class_name instance_name*** will create an instance of the specified class from the *palette* with the specified instance name and call the new component instance's `setServices` method.

```
cca>instances
FRAMEWORK of type Ccaffeine-Support

cca>instantiate drivers.CXXDriver driversCXXDriver
driversCXXDriver of type drivers.CXXDriver
successfully instantiated

cca>instantiate functions.PiFunction functionsPiFunction
functionsPiFunction of type functions.PiFunction
successfully instantiated

cca>instantiate integrators.MonteCarlo integratorsMonteCarlo
integratorsMonteCarlo of type integrators.MonteCarlo
successfully instantiated

cca>instantiate randomgens.RandNumGenerator randomgensRandNumGenerator
randomgensRandNumGenerator of type randomgens.RandNumGenerator
successfully instantiated

cca>instances
FRAMEWORK of type Ccaffeine-Support
driversCXXDriver of type drivers.CXXDriver
functionsPiFunction of type functions.PiFunction
integratorsMonteCarlo of type integrators.MonteCarlo
randomgensRandNumGenerator of type randomgens.RandNumGenerator
```

Note

When you instantiate a component, you can name it whatever you like as long as it is unique with respect to all of the components that you've instantiated in your session with the framework. It is possible to instantiate the a given component class multiple times (with different names, of course).

5. Once the components you need are instantiated, you need to connect up their ports appropriately. The **display chain** command will list the component instances in Ccaffeine's *arena* and any connections among their ports. To make a connection, you use the command **connect *user_instance_name user_port_name provider_instance_name provider_port_name*** (note that some of the input lines have been folded with "\" to fit on the

page -- you'll have to rejoin them when you type in the commands because Ccaffeine doesn't understand continuation lines):

```
cca>display chain
Component FRAMEWORK of type Ccaffeine-Support                    (1)
Component driversCXXDriver of type drivers.CXXDriver
Component functionsPiFunction of type functions.PiFunction
Component integratorsMonteCarlo of type integrators.MonteCarlo
Component randomgensRandNumGenerator of type randomgens.RandNumGenerator

cca>connect driversCXXDriver IntegratorPort integratorsMonteCarlo \
    IntegratorPort
driversCXXDriver))))IntegratorPort---->IntegratorPort((((integratorsMonteCarlo
connection made successfully                                     (2)

cca>connect integratorsMonteCarlo FunctionPort functionsPiFunction \
    FunctionPort
integratorsMonteCarlo))))FunctionPort---->FunctionPort((((functionsPiFunction
connection made successfully                                     (2)

cca>connect integratorsMonteCarlo RandomGeneratorPort \
    randomgensRandNumGenerator RandomGeneratorPort
integratorsMonteCarlo))))RandomGeneratorPort---->\
RandomGeneratorPort((((randomgensRandNumGenerator
connection made successfully                                     (2)

cca>display chain                                                (3)
Component FRAMEWORK of type Ccaffeine-Support
Component driversCXXDriver of type drivers.CXXDriver
 is using IntegratorPort connected to Port: IntegratorPort provided by \
 component integratorsMonteCarlo
Component functionsPiFunction of type functions.PiFunction
Component integratorsMonteCarlo of type integrators.MonteCarlo
 is using FunctionPort connected to Port: FunctionPort provided by \
 component functionsPiFunction
 is using RandomGeneratorPort connected to Port: RandomGeneratorPort \
 provided by component randomgensRandNumGenerator
Component randomgensRandNumGenerator of type randomgens.RandNumGenerator
```

(1) At this point, there are no connections, so the output of **display chain** looks very much like that of **instances** -- just a simple listing of the component instances in the *arena*.

(2) Characteristic of the output of a **connect** command is the ASCII “cartoon” illustrating the connection, with the *user* on the left and the *provider* on the right.

(3) Now the output of **display chain** lists the connections associated with each component instance. Note that the connection information is printed with the *using* component instance only.

Note

Port names and port types are defined by the person who implements the component. They have to be unique within the component, but not across an entire application. In order to connect a *uses* port to a *provides* port, the *types* of the port must match, but the names need not match.

Tip

In the Ccaffeine framework, you can find out what ports a particular component *uses* and *provides* with the command **display component *instance_name***:

```
cca>display component integratorsMonteCarlo
-----------------------------------
Instance name: integratorsMonteCarlo
Class name: integrators.MonteCarlo
-----------------------------------
UsesPorts registered for integratorsMonteCarlo

0. Instance Name: FunctionPort Class Name: function.FunctionPort
1. Instance Name: RandomGeneratorPort Class Name: \
   randomgen.RandomGeneratorPort
-----------------------------------
ProvidesPorts registered for integratorsMonteCarlo

Instance Name: IntegratorPort Class Name: integrator.IntegratorPort
-----------------------------------
```

6. At this point, you have a fully-assembled application and are ready to run it!

   While most CCA ports are defined by component developers, the CCA specification includes a special port named `GoPort`. The purpose of this port is have a way of kicking off the execution of a component. The command **go *instance_name go_port_name*** instructs the framework to invoke the specified go port:

   ```
   cca>go driversCXXDriver GoPort
   Value = 3.141768
   ##specific go command successful
   ```

   and you can see a (fairly inaccurate) value for pi computed by Monte Carlo integration of the function $4/(1+x^2)$.

   At this stage, you have successfully composed and run a CCA application based on existing components. In the remainder of this procedure, we'll see how it is possible to dynamically change the application you've assembled by disconnecting components and connecting others in their place. Or you can jump straight to Step 11 to (gracefully) end this session with Ccaffeine and move on to other procedures in this chapter, or on to other tasks altogether.

7. At the moment, Ccaffeine's *palette* contains only the components we needed for the first application. Now, we'll add some more components to the *palette* and instantiate them in the *arena*:

   ```
   cca>repository get-global integrators.Midpoint
   Loaded integrators.Midpoint NOW  GLOBAL .

   cca>instantiate integrators.Midpoint integratorsMidpoint
   integratorsMidpoint of type integrators.Midpoint
   successfully instantiated

   cca>repository get-global functions.CubeFunction
   Loaded functions.CubeFunction NOW  GLOBAL .

   cca>instantiate functions.CubeFunction functionsCubeFunction
   functionsCubeFunction of type functions.CubeFunction
   successfully instantiated
   ```

Note

There is no harm in having components you don't use in the *palette*, or even having instances of them in the *arena*.

8. In order to be able to swap out components for others, we first need to disconnect them. The **disconnect** command has the same syntax as the **connect** command, with both the *uses* and *provides* end points of the connection being specified.

   Let's begin by changing the Monte Carlo integrator for another. The integrator is connected to both the driver and the function. (And also to the random number generator, but since we don't need it for anything else, there is no harm in leaving that connection intact.)

```
cca>disconnect driversCXXDriver IntegratorPort integratorsMonteCarlo \
    IntegratorPort
driversCXXDriver))))IntegratorPort-\ \-IntegratorPort((((integratorsMonteCarlo
connection broken successfully                                          (1)

cca>disconnect integratorsMonteCarlo FunctionPort functionsPiFunction \
    FunctionPort
integratorsMonteCarlo))))FunctionPort-\ \-FunctionPort((((functionsPiFunction
connection broken successfully                                          (1)
```

   (1) The **disconnect** command prints an ASCII cartoon of a broken connection, similar to that printed by the **connect** command.

Note

Step 7 and Step 8 could have been done in either order.

9. Once we connect up a new integrator (in this case, using the mid-point rule algorithm) to the driver and function, we have a new “application” that's ready to run:

```
cca>connect driversCXXDriver IntegratorPort integratorsMidpoint \
    IntegratorPort
driversCXXDriver))))IntegratorPort---->IntegratorPort((((integratorsMidpoint
connection made successfully

cca>connect integratorsMidpoint FunctionPort functionsPiFunction \
    FunctionPort
integratorsMidpoint))))FunctionPort---->FunctionPort((((functionsPiFunction
connection made successfully

cca>display chain
Component FRAMEWORK of type Ccaffeine-Support
Component driversCXXDriver of type drivers.CXXDriver
 is using IntegratorPort connected to Port: IntegratorPort provided by \
 component integratorsMidpoint
Component functionsCubeFunction of type functions.CubeFunction (1)
Component functionsPiFunction of type functions.PiFunction
Component integratorsMidpoint of type integrators.Midpoint
 is using FunctionPort connected to Port: FunctionPort provided by \
 component functionsPiFunction
Component integratorsMonteCarlo of type integrators.MonteCarlo (1)
 is using RandomGeneratorPort connected to Port: RandomGeneratorPort \
 provided by component randomgensRandNumGenerator
```

```
Component randomgensRandNumGenerator of type \                    ❶
 randomgens.RandNumGenerator

cca>go driversCXXDriver GoPort
Value = 3.141553
##specific go command successful
```

❶ Observe that there are a number of component instances in the *arena* that we have either never used (`functionsCubeFunction`) or which we have disconnected from the rest of the application (`integratorsMonteCarlo` and `randomgensRandNumGenerator`).

10. Finally, we swap the pi function for an x^3 function and run a third application built from the same set of components:

```
cca>disconnect integratorsMidpoint FunctionPort functionsPiFunction \
    FunctionPort
integratorsMidpoint))))FunctionPort-\ \-FunctionPort((((functionsPiFunction
connection broken successfully

cca>connect integratorsMidpoint FunctionPort functionsCube FunctionPort
integratorsMidpoint))))FunctionPort---->FunctionPort((((functionsCubeFunction
connection made successfully

cca>display chain
Component FRAMEWORK of type Ccaffeine-Support
Component driversCXXDriver of type drivers.CXXDriver
 is using IntegratorPort connected to Port: IntegratorPort provided by \
 component integratorsMidpoint
Component functionsCubeFunction of type functions.CubeFunction
Component functionsPiFunction of type functions.PiFunction
Component integratorsMidpoint of type integrators.Midpoint
 is using FunctionPort connected to Port: FunctionPort provided by \
 component functionsCubeFunction
Component integratorsMonteCarlo of type integrators.MonteCarlo
 is using RandomGeneratorPort connected to Port: RandomGeneratorPort \
 provided by component randomgensRandNumGenerator
Component randomgensRandNumGenerator of type randomgens.RandNumGenerator

cca>go driversCXXDriver GoPort
Value = 0.250010
##specific go command successful
```

11. To exit Ccaffeine "politely" and allow it to cleanly shutdown and destroy all components, use the **quit** command:

```
cca>quit

bye!
exit
```

2.2. Running Ccaffeine Using an `rc` File

In practice, most people don't use Ccaffeine interactively on a routine basis. Like many applications, Ccaffeine can be run with a script, or "`rc`" file that tells it what to do. Any commands that can be entered at the `cca>` prompt can be used in an `rc` file, so it is possible to systematically capture the as-

sembly and execution of an application in a reusable form. The `rc` also makes it easy to create a new application from an existing one by adapting the script.

In this section, you will explore the use of an `rc` file that captures all of the commands performed in the previous section. This is the basic approach you will want to use when testing your work in the subsequent exercises.

1. For this procedure, it is best to work in your home directory. To save you a lot of additional typing, we've created an `rc` file with all of the commands from the previous section. Make a local copy by typing **`cp tutorial-src/components/examples/task0_rc .`** and open it in your text editor. Here are some of the important features to note in this file:

```
#!ccaffeine bootstrap file. ❶
# ------- don't change anything ABOVE this line.------------- ❷

# Step 2 ❷

path
path set tutorial-src/components/lib ❸
path

# Step 3 ❷

display chain
go driversCXXDriver GoPort

# Step 11

quit (4)
```

(1) Ccaffeine requires this line exactly as written to recognize this file as an input script.
(2) Ccaffeine interprets "#" as the beginning of a comment and ignores the remainder of the line. (Note that we have marked only the first few comments in this file.)
(3) In your copy of the `rc` file, this should be the fully-qualified path to the *`tutorial-src`* directory.
(4) If your script does not contain a **quit** command, Ccaffeine will run the script and leave you at the Ccaffeine prompt, "`cca>`", allowing you to interact with the framework manually. For example, you can use the `rc` file just to setup the *palette*; or you can use it to setup the *palette* and instantiate the components you need in the *arena*; or you can use it to assemble the entire application, but type the **go** command yourself.

2. Enter the command **`ccafe-single --ccafe-rc task0_rc >& task0p1.out`** (assuming you're using the **csh** or **tcsh** shells; if you're using the **sh** or **bash** shells, the command is **`ccafe-single --ccafe-rc task0_rc > task0.out 2>&1`**)

   Edit the `task0.out` file and compare the results with those in the prior section. Everything should be essentially the same.

3. Experiment with changing `task0_rc` and re-running Step 2. Take a careful look at the output to make sure each change worked as you expected.

   Some suggestions for things to change:

   - Rearrange some of the commands so that all of the **repository get-global** commands are at the beginning of the file; you could also group all of the instantiations together. Done properly, this should have no effect your ability to execute the applications.
   - Since the original script assembles and runs three distinct applications, you might modify the script so that it does only one by commenting out the lines that aren't needed.
   - Make use of the `drivers.F90Driver` which has not been used at all so far. (This means you will have to add **repository get-global** and **instantiate** commands for it.)

Tip

You can copy the original `task0_rc` to other filenames if you want to preserve the different variations you try. If you're just eliminating lines (for example to run only a single application), it may be convenient to just comment them out instead of actually removing them.

Warning

If you remove the **quit** command from the `rc` file, Ccaffeine will leave you in interactive mode rather than terminating and returning you to the shell prompt. In this case, you should *not* capture Ccaffeine's output into a file, as instructed in Step 2 because you won't be able to see the `cca>` prompt and it will *appear* that Ccaffeine has hung (in reality it is just waiting for your input). If you make this mistake a **Control-c** will interrupt Ccaffeine and return you to the shell prompt.

2.3. Using the GUI Front-End to Ccaffeine

There is a graphical front-end for Ccaffeine (which doesn't have a particular name yet; we'll just refer to as "the GUI") which provides a fairly simple visual programming metaphor for the assembly of applications using CCA components. If you've been through the previous sections of this chapter, you'll already recognize that using the GUI is entirely optional. As with many environments that offer both graphical and non-graphical interfaces, we find that new/inexperienced users tend to like the GUI, while once they "get the hang" of using the CCA, they tend to prefer text-based scripting, as in Section 2.2, " Running Ccaffeine Using an rc File ".

In this section, we'll present the same sequence of operations as in Section 2.1, "A CCA Application in Detail" and Section 2.2, " Running Ccaffeine Using an rc File " using the GUI. We'll focus on the mechanics of using the GUI and assume that you've work through (or at least read) the previous sections to understand what's going on in the Ccaffeine instance running behind the GUI, and in the CCA components within Ccaffeine.

2.3.1. Running Ccaffeine with the GUI

Ccaffeine and its GUI are run as two separate processes, possibly on two different machines. In any event, you'll need two separate terminal sessions to control and monitor the two processes. We will refer to these as "*Ccaffeine host*" and "*GUI host*".

In this exercise, we will invoke Ccaffeine on the *Ccaffeine host* with:

```
gui-backend.sh --port 3314 \ (1)
               --ccafe-rc rc_file \ (2)
```

(1) This tells Ccaffeine the port number to expect the GUI to connect to. Typically, *`listener_port`* can be any port number between 1025 and 65535 that doesn't conflict with another application wanting to use the same port. In this Guide, we will use port 3314, but you can change this if it is problematic.

Warning

If you're working in a setting in which there may be more than one person using Ccaffeine on the same system, *you must choose different ports, or you will conflict!* Choosing anything besides the default port, the chances of a conflict are small.

If you're participating in an organized CCA tutorial, we'll assign you a port number to use for the GUI as part of your account information as a simple way to insure there are no conflicts. *Please use your assigned port number* in this case!

❷ An `rc` file is required in order to set the component search path and do the **repository get-global** commands to load the required components into the *palette*.

The default for **ccafe-client** (and **ccafe-batch**) is to direct most of their own output, as well as the output from applications within them, to files named `pOut`*n* (for the stdout stream) and `pErr`*n* (for the stderr stream), where *n* denotes the MPI rank of the process. (In this Guide, we'll be running sequentially, so we'll have only `pOut0` and `pErr0`.) The **gui-backend.sh** script invokes **ccafe-client** with the `--ccafe-io2tty` to direct its output to the terminal instead of to the files (the files will still be created, but will contain just a few startup messages relating to the MPI rank and the process id). Using `--ccafe-io2tty` is more convenient for more interactive development work, but if you're going to run an actual application, you probably want to capture the output in the files instead. With the current **gui-backend.sh**, this would require modifying the script, but for "production" computing with CCA, we expect most people to use the `rc` approach of the previous section rather than the GUI.

The Ccaffeine GUI is implemented in Java, and is available as a `jar` file that can be used with any recent version of the Java runtime or the full software development kit. Because the Java invocation is long and hard to remember, we provide convenience scripts to simplify using it. Which one you need depends on your circumstances:

gui.sh — This is the script to use if you're running the GUI on the *same machine* as the backend. This script is configured and installed as part of the CCA tools build process.

simple-gui.sh — This is the script to use if you're running the GUI on a *Linux-like machine* and want to connect to Ccaffeine running *remotely*. You will need to download this to your local machine, along with the GUI's `jar` file, following the directions in Section B.2, "The Ccaffeine GUI".

simple-gui.bat — This is the script to use if you're running the GUI on a *Windows machine* and want to connect to Ccaffeine running *remotely*. You will need to download this to your local machine, along with the GUI's `jar` file, following the directions in Section B.2, "The Ccaffeine GUI".

Below, we will refer to **simple-gui.sh**, but you should replace it with whichever command is appropriate for your situation.

Note

While the GUI can be run remotely, using the X11 protocol to display on your local X11 server, this is generally unacceptably slow because of the way Java handles graphics in X11. You will probably get more satisfactory performance if you can run the GUI on your local system and allow it to connect over the network to the remote host where you're running Ccaffeine. Tunneling the GUI-Ccaffeine connection over your ssh connection is a straightforward way to deal with firewalls that often prevent direct access to most ports on remote hosts. It has the added advantage, for the purposes of this Guide, that you would use the same arguments to invoke the GUI running remotely through a tunnel or locally on the same machine as the backend. For more information, see Appendix A, *Remote Access for the CCA Environment* and in particular Section A.3, "Tunneling other Connections

through SSH".

In this exercise, we will invoke the GUI on the *GUI host* with:

```
simple-gui.sh --builderPort 3314 \ (1)
        --host localhost (2)
```

(1) This tells the GUI which port to use for the connection to *Ccaffeine host*. In general, it should match the **ccafe-client** `--port` option (though when tunneling the connection through ssh, that need not be the case).

(2) This tells the GUI which host to connect to for the Ccaffeine backend. In general, it should be the *Ccaffeine host* (though when tunneling the connection through ssh, it would be `localhost`).

Note

Ccaffeine should be running and ready to receive the GUI's connection before you start the GUI. If you're scripting their execution, especially on the same machine, the **sleep** command can help build in a few seconds of delay.

Note

Once the GUI displays on your screen, it may take a few more seconds before it will respond to user actions.

2.3.2. Assembling and Running an Application Using the GUI

1. Run **gui-backend.sh** on the *Ccaffeine host*.

   In the *Ccaffeine host* terminal window, you will see something like:

```
(Ccaffeine host)
(19419) CmdLineClientMain.cxx: execName is ccafe-client
(19419) CmdLineClientMain.cxx: runType is CLIENT
(19419) CmdLineClientMain.cxx: If execName is unexpected, blame your MPI startu
(19419) CmdLineClientMain.cxx: If MPI_Init is unwanted, try adding the switch '
(19419) CmdLineClientMain.cxx: or try setenv CCAFE_USE_MPI 0 .
(19419) CmdLineClientMain.cxx: MPI_Init being called.
(19419) CmdLineClientMain.cxx: MPI_Init succeeded.
(19419) my rank: 0, my pid: 19419
(19419) MapEverythingToFile(pOut0, pErr0)
Type: Server
```

   which is similar to what you saw running **ccafe-single** in Step 1 of Section 2.1, "A CCA Application in Detail", except that in **ccafe-client**, MPI is configured "on" by default. The next-to-last line is special to **ccafe-client** (and **ccafe-batch**) and serves as a reminder that by default, the stdout and stderr output streams from these executables are funneled to the indicated files. This message appears (and the files are created, but with minimal content) even though we used the `--ccafe-io2tty` option.

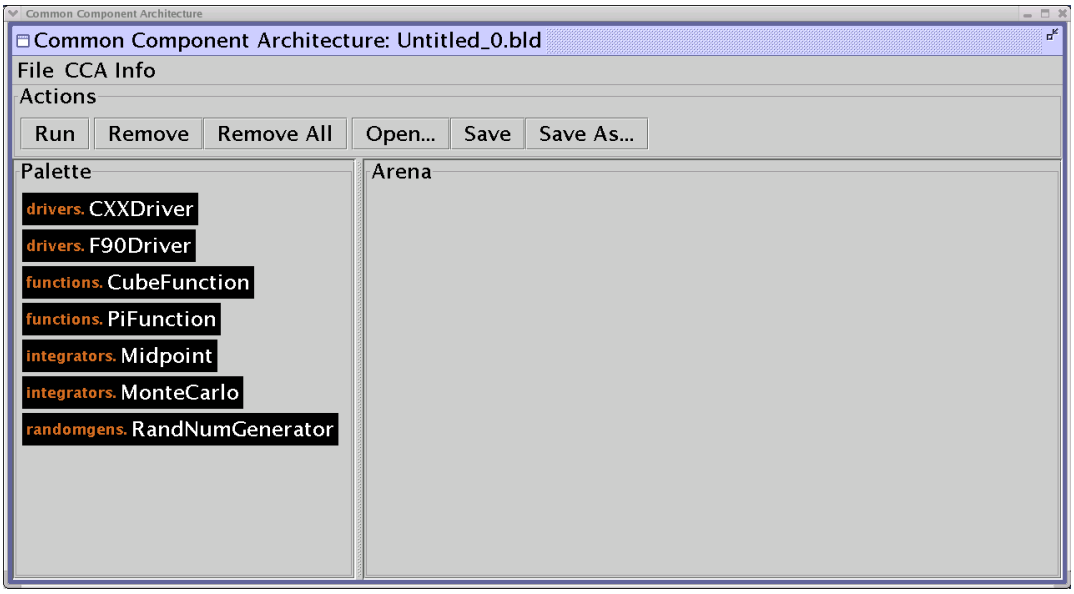
2. Run the **simple-gui.sh** on the *GUI host*.

Once the GUI connects to Ccaffeine, Ccaffeine begins running the `rc` file it was invoked with. In the *GUI host* terminal window, you first see some startup messages from the GUI itself, followed by a series of messages as Ccaffeine processes the `rc` file and the GUI displays the results. These are debugging messages and can largely be ignored. In the *Ccaffeine host* terminal, you should see some additional messages as Ccaffeine processes the `rc` file, like:

```
(Ccaffeine host)
CCAFFEINE configured with babel.
CmdLineClient parsing ...

CmdContextCCAMPI::initRC: Found /.automount/whale/root/san/r1a0l0/bernhold/task
# There are allegedly 8 classes in the component path
```

Finally, you should see a "`gui>`" prompt in the *GUI host* terminal window, and the GUI itself should have appeared on your display, looking something like this:



Tip

The default layout has the *palette* area fairly narrow. You can click-and-drag on the bar separating the *palette* and the *arena* to adjust the width.

As mentioned above, the `task0_setup_rc` sets up the **path** and performs the appropriate **repository get-global** commands. (Note that in this case, all of the available components have been included, for convenience, whereas in the previous command-line based procedures, the **repository get-global** commands appeared in two different places.)

3. At this point, you've completed the equivalent of the first three steps in Section 2.1, "A CCA Application in Detail" (as well as the additional **repository get-global** commands in Step 7) or in the `rc` file described in Section 2.2, " Running Ccaffeine Using an rc File ".

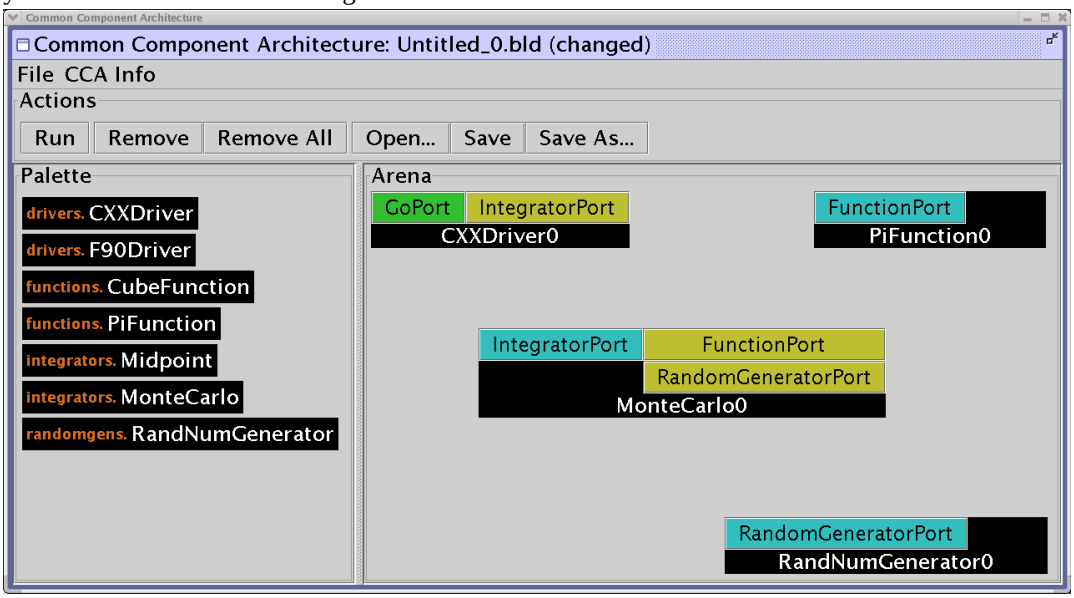
   For the remainder of this procedure, each step will be functionally equivalent to the matching step of the command-line based procedures described above. Please refer to those sections for more detailed explanations of what is happening "behind the scenes".

4. We will begin by instantiating a `drivers.CXXDriver` component. Click-and-drag the component you want from the *palette* to the *arena*. When you release the mouse button in the *arena*, a dialog box will pop up prompting you to name this instance of the component. The default will be the last part of the component's class name (i.e. `CXXDriver` for `drivers.CXXDriver`) with a numerical suffix to insure the name is unique. The suffix starts at 0 and simply counts up according to the number of instances of that component you've created in that session. You can, of course, enter any instance name you like, as long as it is unique across all components in the *arena*, but for simplicity, we will always simply accept the default value in this Guide.

   For the first application, you should instantiate

   - `drivers.CXXDriver`,
   - `functions.PiFunction`,
   - `integrators.MonteCarlo`,
   - `randomgens.RandNumGenerator`,

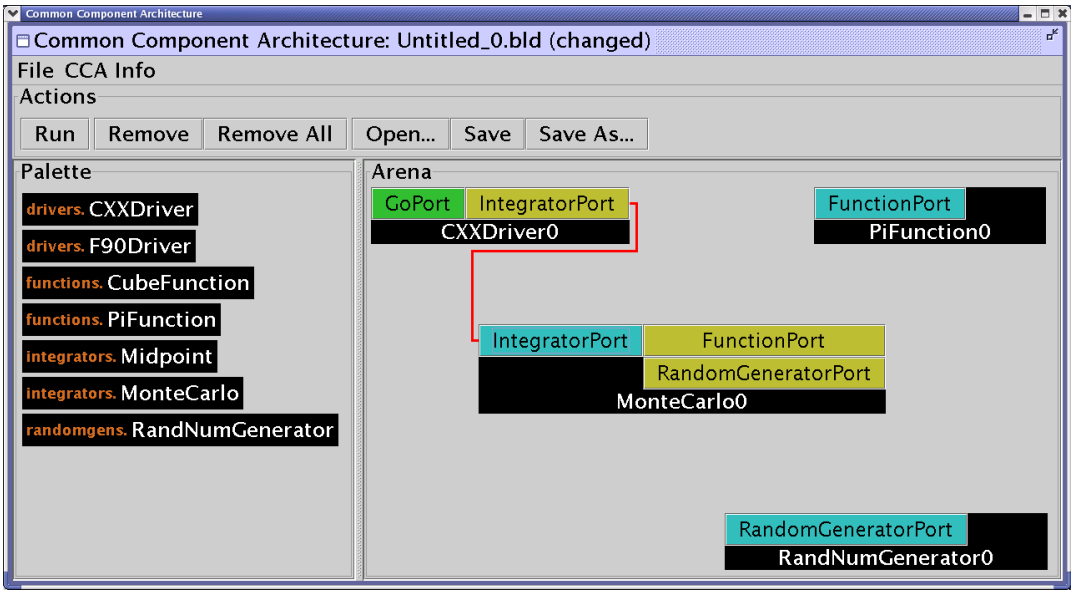
   (you may notice some debugging messages in the *GUI host* terminal window as you do this), and your GUI should look something like this:



Tip

You can drag components around the *arena* to arrange them as suits you. The positions have no bearing on the operation of the GUI or your application.

5. The next step is to begin making connections between the ports of your components. Click-and-release `CXXDriver0`'s `IntegratorPort` *uses* port, then click-and-release `MonteCarlo0`'s `IntegratorPort` *provides* port and a red line should be drawn between the two:



Tip

If you hover the cursor over a particular port on a component, a “tool tip” box will pop up with the port's name and type based on the arguments to the `addProvidesPort` or `registerUsesPort` calls in the component's `setServices` method. This can be useful for double checking to make sure you're connecting matching ports.

Also notice that when you hover over a particular port (either *uses* or *provides*), matching ports of the opposite type (either *provides* or *uses*) will be highlighted.

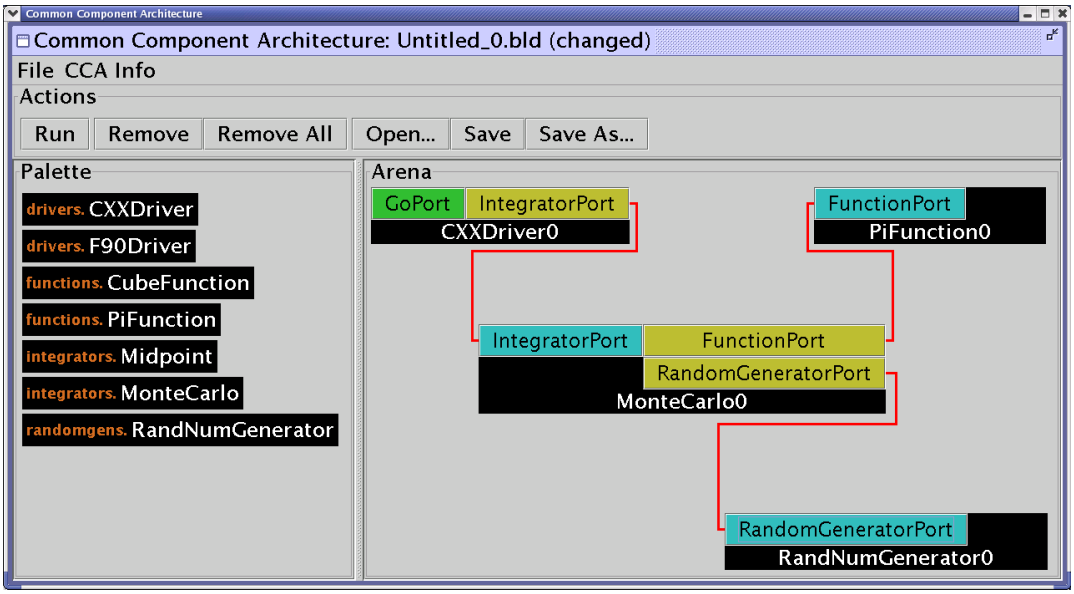
Note

You can move components around even after their ports are connected -- the connections will automatically rearrange. There is no harm in connections crossing each other, nor in connections passing behind other components (though of course they may make it harder to interpret the “wiring diagram” correctly).

Complete the first application by making the following connections:

- `CXXDriver0`'s `IntegratorPort` to `MonteCarlo0`'s `IntegratorPort`
- `MonteCarlo0`'s `FunctionPort` to `PiFunction0`'s `FunctionPort`
- `MonteCarlo0`'s `RandomGeneratorPort` to `RandNumGenerator0`'s `RandomGeneratorPort`.

At this point, your GUI should look something like:

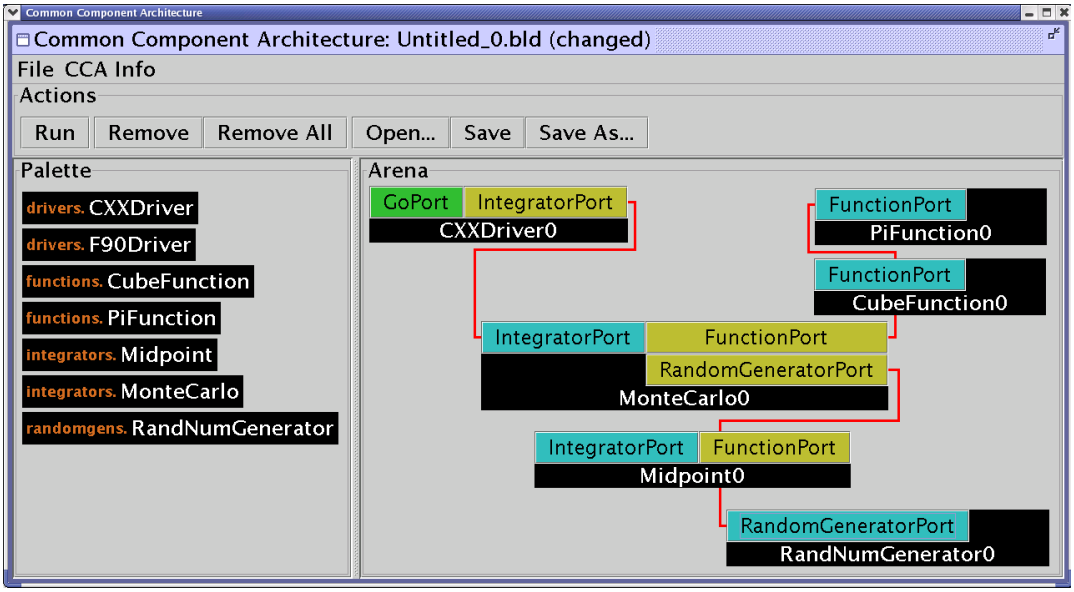


6. The application is now fully assembled and is ready to run. If you click-and-release the `GoPort` button on the `CXXDriver0` component, you should see the result appear in the *Ccaffeine host* terminal, "`Value = 3.141449`" and the message "`##specific go command successful`" in the *GUI host* terminal.

7. Next, we're going to use some of the other components to assemble a different application using the

   - `integrators.Midpoint` and
   - `functions.CubeFunction`

   components. Since they're already in the *palette*, you can instantiate them in the same way as Step 4.



Tip

As we've mentioned, wiring diagrams can become hard to interpret when they become

cluttered, as is the case with the screen shot above. To help interpret the diagram, remember the following:

- "Wires" only connect to the *sides* of ports -- on the left side of *provides* ports (on the left side of the component), or on the right side of *uses* ports. Connections are never made to the top or bottom of a component.
- The GUI's wire-drawing algorithm is aware only of the two components that are being connected. It will make no attempt to avoid other components or other wires. So wires can pass behind components without connecting to any of their ports, and wires may overlap.
- If you're still uncertain how to interpret the connections try rearranging the components slightly. Connections will follow as you drag a component around, but others not associated with that component will remain unchanged.

8. Next, we break the port connections we don't need so we can reconnect to the new components. Right-click on the `IntegratorPort` (either the *user* or the *provider*) and a dialog box will pop up asking you to confirm that you want to break the connection. You will need to break the following connections:

   - `CXXDriver0`'s `IntegratorPort` to `MonteCarlo0`'s `IntegratorPort`
   - `MonteCarlo0`'s `FunctionPort` to `PiFunction0`'s `FunctionPort`

   The fact that `MonteCarlo0` remains connected to `RandNumGenerator0` is immaterial because neither component will be used in the remainder of this exercise.

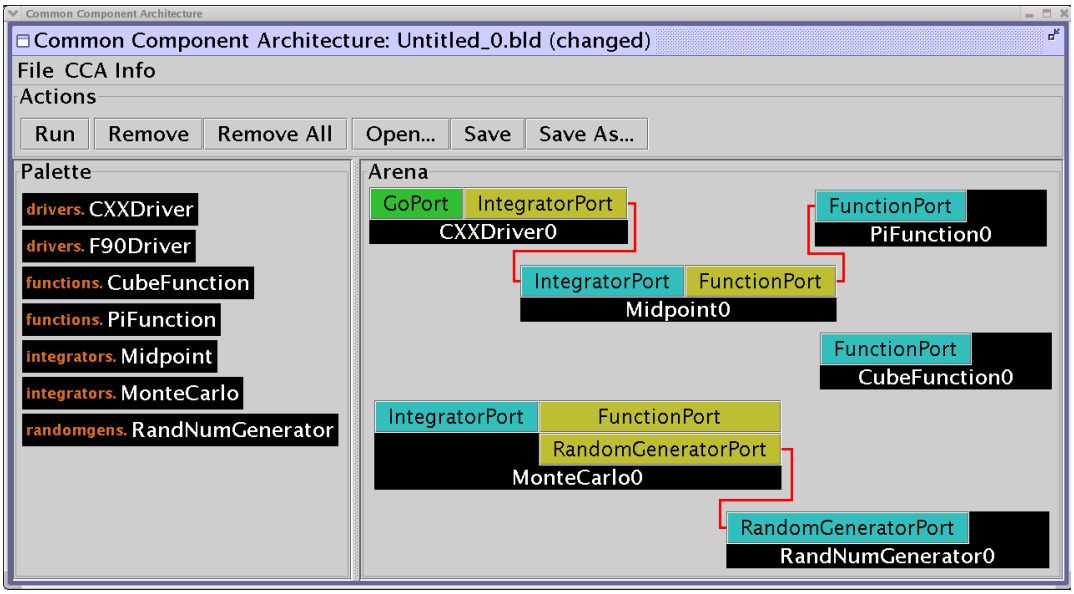
   

   ## Note

   Step 7 and Step 8 could have been done in either order.

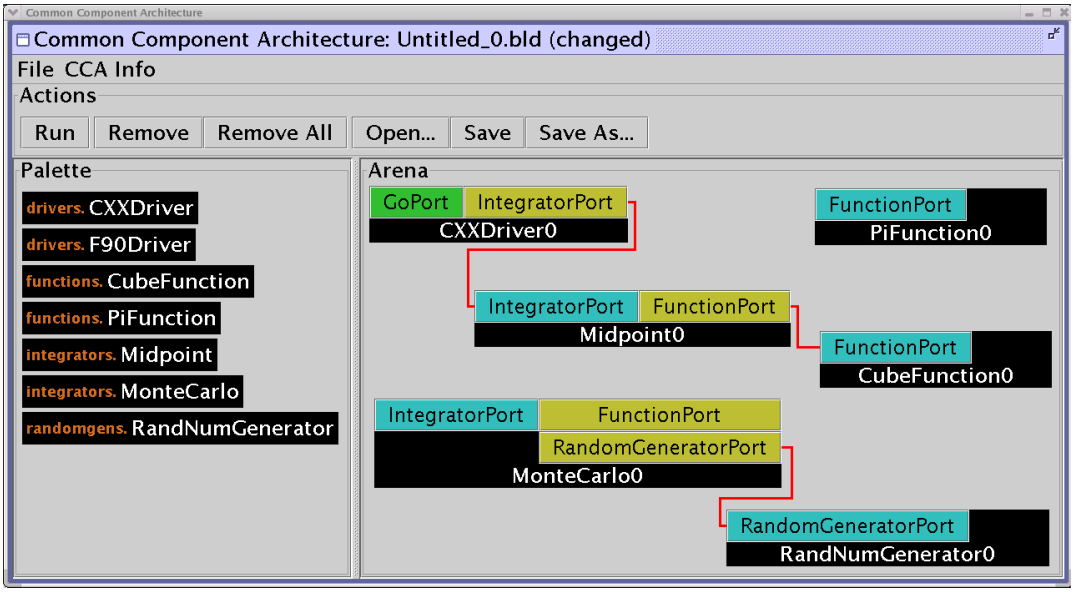
9. Assemble the new application by making the following connections:

   - `CXXDriver0`'s `IntegratorPort` to `Midpoint0`'s `IntegratorPort`
   - `Midpoint0`'s `FunctionPort` to `PiFunction0`'s `FunctionPort`



Click-and-release the `GoPort` button on the `CXXDriver0` component, you should see the result appear in the *Ccaffeine host* terminal, "`Value = 3.141553`" and the message "`##specific go command successful`" in the *GUI host* terminal.

10. Finally, create a third application by replacing `PiFunction0` with `CubeFunction0`. When you click on the `GoPort` you should get "`Value = 0.250010`" in the *Ccaffeine host* terminal.



11. To politely exit the GUI, select File->Quit. This will terminate both the GUI and the backend **ccafe-client** sessions.

Tip

If you've used the GUI to setup and start a long-running simulation, and you don't want to leave the GUI running continuously, you can use the File->Detach option to close the GUI but leave the backend running. *However it is currently impossible to*

reattach to a running session.

2.3.3. Notes on More Advanced Usage of the GUI

There are a couple of other features of the GUI and its interaction with the Ccaffeine backend that are worth mentioning.

- The `rc` file used in conjunction with a GUI session need not be limited to **path** and **repository get-global** commands -- it is possible to include all Ccaffeine commands, such as in the script of Section 2.2, " Running Ccaffeine Using an rc File ". The GUI will display all instantiated components, and all connections between their ports. However, the GUI has no mechanism to *place* the components intelligently in the *arena*, so it just puts them all on top of each other. You can, of course, drag them into more reasonable positions.
- It is possible to save the visual state of the GUI in a "`.bld`" file using the Save or Save As... button. The `.bld` file can be loaded into the GUI and replayed by launching it with the `--buildFile` *`file.bld`* option.

  The syntax of the `.bld` file is similar to that of the `rc` file, but they are *not* interchangeable. The `.bld` file can contain commands to instantiate and destroy components and to connect and disconnect ports, as well as commands to move components within the *arena*, and it can only be interpreted by the GUI. The **path** and **repository get-global** commands must always be in the `rc` file, which is interpreted only by the Ccaffeine backend. Also, Ccaffeine itself does not understand the movement commands of the `.bld` file.

Chapter 3. Sewing CCA Components into an Application: the Driver Component

$Revision: 1.33 $
$Date: 2004/10/10 21:10:08 $

In this exercise, you will create a new Driver component. This component is very simple, and basically only *uses* other components (it also *provides* a GoPort). If you're working in an environment in which components are already available that do *most* of what you need, it is often sufficient to create a component, which we refer to generically as a *driver*, that orchestrates these existing components to perform your computation.

Unlike other component models (e.g. Cactus [http://citeseer.nj.nec.com/allen00cactus.html] or ESMF [http://sdcd.gsfc.nasa.gov/ESS/esmf_tasc/]) CCA does not impose a built-in execution model. CCA allows the user to determine how the components are to be used. The driver component, in essence, takes the place of the main program in a normal application.

In this section we will walk through the construction of a driver component, either in Fortran (SIDL name `drivers.F90Driver`) or C++ (SIDL name `drivers.CXXDriver`) Regardless of language, our driver component will *use* an `integrator.IntegratorPort`. It will also *provide* a `gov.cca.ports.GoPort` that allows an outside entity (a user or script) to start execution of the component. (These ports should be familiar from Chapter 2, *Assembling and Running a CCA Application*.)

Note

This and subsequent exercises use the `student-src` code tree. You'll need to build the code tree, following the instructions in Appendix C, *Building the Tutorial and Student Code Trees*. If you are participating in an organized tutorial your account information handout will tell you where you can obtain the tar file on the system you're using instead of having to download it.

3.1. The SIDL Definition of the Driver Component

The first step in creating a new component is to create its `.sidl` file. In SIDL, a component is a class that implements several SIDL interfaces. All CCA components must implement the `gov.cca.Component` interface, which is defined as part of the CCA specification (the CCA specification uses the `gov.cca` namespace). In addition, components must implement the interfaces corresponding to any CCA ports they wish to *provide*. The CCA specification defines a few ports, such as `gov.cca.ports.GoPort`, but mostly, ports are defined by the people who write components, or by communities that get together to agree on a "standard" interface.

In order to better understand what is required to implement a given interface, you need to find the SIDL specification for it. First, we'll look in the SIDL file for the CCA specification to see what the `gov.cca.Component` interface looks like.

1. Edit *`CCA_TOOLS_ROOT`*`/share/cca-spec-babel-0_7_0-babel-0.9.4/cca.sidl`.

First, notice the package declarations at the beginning of the file:

```
package gov {
package cca version 0.7.0 {
...
```

which declare the `gov.cca` namespace for everything in the file.

2. Now, search for “interface Component”:

```
...
    /**
     * All components must implement this interface.
     */
    interface Component {
        ... Comments elided ...
        void setServices(in Services services) throws CCAException;
    }
...
```

Which tells us that our driver will have to implement a `setServices`. This is the key method that allows a piece of code to become a CCA component. The component's `setServices` method is invoked by the CCA framework when the component is instantiated, and advertises to the framework the ports the component will *provide* and *use*.

3. Since the port this component *provides* is also part of the CCA specification, this is the place to look for the definition of the `GoPort`. Search for “interface GoPort”:

```
...
    package ports {

        /**
         * Go, component, go!
         */
        interface GoPort extends Port {
            ... Comments elided ...
            int go();
        }
...
```

First, notice that there is an additional package declaration here, making the full name of this interface `gov.cca.ports.GoPort`. This definition tells us that our driver component must also implement a `go` method.

4. Now you have enough information to write the SIDL declaration for your driver component. At this point, you should choose whether you want to implement your driver component in C++ or Fortran 90. (Once you get one done, you can implement the other too, if you wish.)

   Edit the file `student-src/components/sidl/drivers.sidl` and type in one of the two following SIDL declarations, according to your choice of language:

   a.

```
package drivers version 1.0 {
  class F90Driver implements gov.cca.ports.GoPort,
                             gov.cca.Component
  {
```

```
        int go();
        void setServices(in gov.cca.Services services)
                         throws gov.cca.CCAException;
    }
}
```

b.

```
package drivers version 1.0 {
  class CXXDriver implements gov.cca.ports.GoPort,
                             gov.cca.Component
  {
     int go();
     void setServices(in gov.cca.Services services)
                      throws gov.cca.CCAException;
  }
}
```

First, notice that the two declarations are identical except for the name, and in reality, you could choose anything you wanted for the name. The only reason we put an indication of the implementation language into the class name of this component was pedagogical: to avoid a name collision if you want to eventually implement both versions, and identify what distinguishes them. Normally, you might want different implementations of a component if they do things differently (i.e. use different algorithms), or in the case of a driver, solve different problems. Under normal circumstances, there is no reason to have more than one implementation of a component that does precisely the same thing.

Second, notice that the class definition references both `gov.cca.ports.GoPort` and `gov.cca.Component`, and declares all of the methods that we saw in those interface definitions, with precisely the same signatures.

5. Now you need to modify the `Makefile` system so that it is aware of the new `drivers.sidl` file and the component you're adding.

   Edit `student-src/component/MakeIncl.components` and make the following additions:

```
# SIDL files containing component declarations
# For example:
# SIDL_FILES = sidl/drivers.sidl
SIDL_FILES = sidl/functions.sidl sidl/integrators.sidl sidl/randomgens.sidl \
             sidl/drivers.sidl

# The COMPONENTS list contains the fully-qualified names of the component
# classes, augmented with -LANGUAGE, where LANGUAGE is the language
# in which the component is implemented, e.g., c, c++, f90.
# For example:
# COMPONENTS = drivers.F90Driver-f90 drivers.CXXDriver-c++
COMPONENTS = functions.PiFunction-c++ \
        integrators.MonteCarlo-f90 randomgens.RandNumGenerator-c++ \
        drivers.CXXDriver-c++
```

   Of course if you've chose to create the Fortran 90 driver, you should add **`drivers.F90Driver-f90`** to the definition of `COMPONENTS` instead. In both cases, notice the backslash ("\") used to continue definition on to the next line. **make** will accept long lines, but the files are easier to read if they're nicely formatted.

6. In the `student-src/components` directory, type **`make .repository`** to make Babel process the `.sidl` files and update the XML repository. The output should look something like this:

```
touch .sidl

### Generating XML for SIDL packages containing component declarations
/san/shared/cca/tutorial/bin/babel -t xml -R../xml_repository \
   -R/san/shared/cca/tutorial/share/cca-spec-babel-0_7_0-babel-0.9.4/xml \
   -o ../xml_repository sidl/functions.sidl sidl/integrators.sidl \
   sidl/randomgens.sidl sidl/drivers.sidl
Babel: Parsing URL "file:/.automount/whale/root/san/r1a0l0/bernhold/\
  student-src/components/sidl/functions.sidl"...
Babel: Warning: Symbol exists in XML repository: \
       functions.LinearFunction-v1.0
Babel: Warning: Symbol exists in XML repository: \
       functions.NonlinearFunction-v1.0
Babel: Warning: Symbol exists in XML repository: \
       functions.PiFunction-v1.0
Babel: Parsing URL "file:/.automount/whale/root/san/r1a0l0/bernhold/\
  student-src/components/sidl/integrators.sidl"...
Babel: Warning: Symbol exists in XML repository: \
       integrators.MonteCarlo-v1.0
Babel: Parsing URL "file:/.automount/whale/root/san/r1a0l0/bernhold/\
   student-src/components/sidl/randomgens.sidl"...
Babel: Warning: Symbol exists in XML repository: \
       randomgens.RandNumGenerator-v1.0
Babel: Parsing URL "file:/.automount/whale/root/san/r1a0l0/bernhold/\
   student-src/components/sidl/drivers.sidl"...
touch .repository
```

The next step is to implement the internals of the component, which are obviously dependent on the implementation language you've chosen. For C++, continue directly on with Section 3.2, “Implementation of the CXXDriver in C++”. For Fortran 90, please jump to Section 3.3, “Implementation of the F90Driver in Fortran 90”.

3.2. Implementation of the `CXXDriver` in C++

1. The next step is to get Babel to generate the skeleton code that we will fill in with the component's implementation. In the `student-src/components` directory, type **`make .drivers.CXXDriver-c++`**. The output should look something like this:

```
### Generating a c++ implementation for the drivers.CXXDriver component.
/san/shared/cca/tutorial/bin/babel -s c++ -R../xml_repository \
   -R/san/shared/cca/tutorial/share/cca-spec-babel-0_7_0-babel-0.9.4/xml \
    -g -u -E -l -m drivers.CXXDriver. --suppress-timestamp drivers.CXXDriver
Babel: Resolved symbol "drivers.CXXDriver"...
touch .drivers.CXXDriver-c++
```

   and in the `student-src/components/drivers/c++` directory, you should see the following files:

```
drivers.CXXDriver.babel.make
```

```
drivers_CXXDriver_Impl.cc
drivers_CXXDriver_Impl.hh
glue
```

all of which were generated by Babel. (`glue` is actually a directory that contains a large number of generated files that Babel needs to do its job, but which you never need to modify.) The source code files that you will need to modify in order to implement the component are the so-called `Impl` files. For C++, both a source file (`.cc`) and the corresponding header file (`.hh`) are generated.

2. In your editor, take a look through both `student-src/components/drivers/c++/drivers_CXXDriver_Impl.cc` and `student-src/components/drivers/c++/drivers_CXXDriver_Impl.hh` to familiarize yourself with their structure before you make any changes.

   a. Near the top of `drivers_CXXDriver_Impl.hh`, you will see a group of include directives:

   ```
   ...
   //
   // Includes for all method dependencies.
   //
   #ifndef included_drivers_CXXDriver_hh
   #include "drivers_CXXDriver.hh"
   #endif
   ...
   ```

   Babel generates include directives for header files that are necessary to resolve the types used in the SIDL definition of the class you're implementing (in this case, in the `student-src/components/sidl/drivers.sidl` file). It does not automatically generate include directives for interfaces you implement. You will have to add those and any other header files your implementation requires as part of the implementation process.

   When an automatically generated file is manually modified, there is always a danger that the modifications will be overwritten the next time the file is generated. Babel solves this with a concept called *splicer blocks*. These structured comments that appear to the compiler as regular comments, but are interpreted by Babel as having a special meaning. Babel will preserve code *within* a splicer block when the file is regenerated. Code outside splicer blocks will be overwritten. Most Babel-generated files contain numerous splicer blocks -- everywhere you might need to add something to the generated skeleton. Here is an example:

   ```
   ...
   // DO-NOT-DELETE splicer.begin(drivers.CXXDriver._includes)
   // Put additional includes or other arbitrary code here...
   // DO-NOT-DELETE splicer.end(drivers.CXXDriver._includes)
   ...
   ```

   Note that each splicer block has a name that is unique within the file, and has explicit beginning and end markers. In this case, the leading comment syntax is appropriate to C++, but of course files generated for other languages will have different ways of denoting comments.

   b. In the `drivers_CXXDriver_Impl.cc`, You will see that Babel has already generated the signatures for all of the methods you need to implement, giving them appropriate C++-ized names, and has provided splicer blocks ready for you to fill in. This includes both the `go` method inherited from the `gov.cca.ports.GoPort` definition, and the `setServices` method inherited from the `gov.cca.Component` definition.

3.2.1. The `setServices` Implementation

1. We'll begin by implementing the `setServices` method in `drivers_CXXDriver_Impl.cc`. Here is what the routine should look like (you'll need to type in the stuff marked up **`like this`**), along with some comments about different sections.

```
...
/**
 * Method:  setServices[]
 */
void
drivers::CXXDriver_impl::setServices (
  /*in*/ ::gov::cca::Services services )
throw (
  ::gov::cca::CCAException
){
  // DO-NOT-DELETE splicer.begin(drivers.CXXDriver.setServices)
  // insert implementation here

  frameworkServices = services; (1)

  // Provide a Go port
  gov::cca::ports::GoPort gp = self; (2)

  frameworkServices.addProvidesPort(gp, (2)
                                    "GoPort",
                                    "gov.cca.ports.GoPort",
                                    frameworkServices.createTypeMap());

  // Use an IntegratorPort port
  frameworkServices.registerUsesPort ("IntegratorPort", (3)
                                      "integrator.IntegratorPort",
                                      frameworkServices.createTypeMap());

  // DO-NOT-DELETE splicer.end(drivers.CXXDriver.setServices)
}
...
```

(1) When the framework calls `setServices`, it passes in a gov.cca.Services object (in C++ gov::cca::Services) that we need to keep a copy of. Note that `frameworkServices` is not declared here. We will add a declaration for it to the `.hh` file in the next step.

(2) In order to register the ports that our component will provide with the framework, we use the `addProvidesPort` method of the `gov.cca.Services` interface. You can find this interface in the `cca.sidl` file (where you previously looked up `gov.cca.Component` and `gov.cca.ports.GoPort`) in order to check its signature, which is:

```
...
void addProvidesPort(in gov.cca.Port inPort,
                     in string portName,
                     in string type,
                     in gov.cca.TypeMap properties )
       throws gov.cca.CCAException ;
...
```

(Of course we're actually calling the C++ version of the interface.)

The first argument is the object that actually provides the port. The way we wrote the SIDL, the `drivers.CXXDriver` class provides the port, and since we're writing a method within this class, C++ allows the enclosing object to be referred to as self (cast to the appropriate type).

The second and third arguments are a local name for the port, which must be unique within the component, and a type, which *should* be globally unique. If the actual types of the ports don't match between *user* and *provider*, it will cause a failed cast or possibly a segmentation fault. The string type here is a convenience to the user, giving a human-readable way to identify the type of the port that can be presented in the framework's user interface. By convention, the SIDL interface name for the port is used for the type.

The final argument is a `gov.cca.TypeMap`. This is a CCA-defined type that provides a simple hash table that can be used to associate properties with a *provides* port. In practice, it is rarely used, but must be present.

❸ We must also tell the framework which ports we expect to *use* from other components. Looking in `cca.sidl`, we find that the method's signature is:

```
...
void registerUsesPort(in string portName,
                      in string type,
                      in gov.cca.TypeMap properties )
     throws gov.cca.CCAException ;
...
```

The first and second arguments are a local name for the port, following the same rules and conventions as in the `addProvidesPort` invocation above. The final argument is, once again, a `gov.cca.TypeMap`, again like `addProvidesPort`.

2. The header file also requires a couple of additions. First, let's take care of declaring `frameworkServices` as a private variable belonging to the `drivers::CXXDriver` class.

   Edit `student-src/components/drivers/c++/drivers_CXXDriver_Impl.hh` and add the following:

```
...
  /**
   * Symbol "drivers.CXXDriver" (version 1.0)
   */
  class CXXDriver_impl
  // DO-NOT-DELETE splicer.begin(drivers.CXXDriver._inherits)
  // Put additional inheritance here...
  // DO-NOT-DELETE splicer.end(drivers.CXXDriver._inherits)
  {

  private:
    // Pointer back to IOR.
    // Use this to dispatch back through IOR vtable.
    CXXDriver self;

    // DO-NOT-DELETE splicer.begin(drivers.CXXDriver._implementation)
    // Put additional implementation details here...

    ::gov::cca::Services frameworkServices;

    // DO-NOT-DELETE splicer.end(drivers.CXXDriver._implementation)
```

```
...
```

3. We also need to add the include directives for the header files for the classes we inherit from. (For technical reasons, Babel does not insert these automatically when it generates the file.)

```
...
// DO-NOT-DELETE splicer.begin(drivers.CXXDriver._includes)
// Put additional includes or other arbitrary code here...

#include "integrator_IntegratorPort.hh"
#include "gov_cca_ports_GoPort.hh"

// DO-NOT-DELETE splicer.end(drivers.CXXDriver._includes)
...
```

   Note that in naming files, Babel translates periods (“.”) in the SIDL to underscores (“_”).

4. Now, although the component is not complete, it is a good idea to check that it compiles correctly with the code you've added so far.

   First, change directories to `student-src/components` and run **`make drivers`**. This will install `Makefile` and `MakeIncl.user` files in `student-src/components/drivers/c++`.

   Then, change directories to `student-src/components/drivers/c++` and run **`make`**. If you get any compiler errors, you should fix them before going on.

3.2.2. The go Implementation

1. Once again, edit `student-src/components/drivers/c++/drivers_CXXDriver_Impl.cc` and add the implementation of the `go` method:

```
...
/**
 * Method:  go[]
 */
int32_t
drivers::CXXDriver_impl::go ()
throw ()

{
  // DO-NOT-DELETE splicer.begin(drivers.CXXDriver.go)
  // insert implementation here

  double value; (1)
  int count = 100000;
  double lowerBound = 0.0, upperBound = 1.0;

  ::integrator::IntegratorPort integrator; (2)

  // get the port ...
```

```
  integrator = frameworkServices.getPort("IntegratorPort"); ❷

  if(integrator._is_nil()) { ❸
    fprintf(stdout, "drivers.CXXDriver not connected\n");
    frameworkServices.releasePort("IntegratorPort");
    return -1;
  }
    // operate on the port
    value = integrator.integrate (lowerBound, upperBound, count);
❹

    fprintf(stdout,"Value = %lf\n", value);
    fflush(stdout);

  // release the port.
  frameworkServices.releasePort("IntegratorPort"); ❺
  return 0; ❻

  // DO-NOT-DELETE splicer.end(drivers.CXXDriver.go)
}
...
```

❶ Setup the parameters with which to call the integrator.

❷ In this section we get a handle to the particular `integrator.IntegratorPort` that the driver's *uses* port has been connected to. First, we have to declare a variable of the appropriate type (::integrator::IntegratorPort is the C++ translation of the SIDL `integrator.IntegratorPort`, defined in `student-src/ports/sidl/integrator.sidl`). Then, we invoke the `getPort` on our `frameworkServices` object. The argument to this method is the local name we used in the `registerUsesPort` invocation.

❸ This code checks that the `getPort` worked, and returned a valid port. If the `getPort` fails, or if the driver's *uses* port has not been connected to an appropriate *provider*, then `getPort` will return a nil port object. The `_is_nil` method is automatically available on all SIDL objects. Because the driver can't do anything without being properly connected to an integrator, the response to `getPort` failing is to abort by returning a non-zero value.

Note

`getPort` returning nil need not be treated as a fatal error in all cases. For example, a component may be designed so that certain ports are optional -- to be used if present, but to be ignored if not. Another possibility is that the component may be able to accomplish the same thing through several different ports, so that only one of a given group needs to be connected.

❹ Here we actually call the `integrate` method on the `integrator` port we just got a handle for. The signature of the `integrate` method is defined in `student-src/ports/sidl/integrator.sidl`.

❺ Finally, once we're done using the port, we call `releasePort`.

❻ It is considered impolite for a component to call `exit` because it will bring down the entire application, and possibly crash the framework. Instead, components should simply return.

2. Congratulations, you have completed the implementation of the `CXXDriver`! To check your work, run **`make`** in `student-src/components/drivers/c++`. If you get any compiler errors, you should fix them before going on.

3. At this point, it is a good idea to go up to `student-src` and run **`make`** to insure that anything

else which might depend on the existence of the new `drivers.CXXDriver` component gets built too.

The next step is to test your new driver component, in Section 3.5, “Using Your New Component”.

3.3. Implementation of the `F90Driver` in Fortran 90

Before we begin the implementation, it is important to understand that, regardless of language, both the CCA and especially Babel/SIDL impose an object-oriented model on any of its supported languages, including Fortran. Most importantly, this means that each Fortran component has *state* and *methods*. State means that variables are associated with a particular instance component and that these *state* variables (sometimes referred to as private data) can take on different values for different instances. A *method* is a subroutine that is associated with the component. A short introduction to the way CCA/Babel deal with imposing an object model on Fortran is given in Section 3.4, “SIDL and CCA Object Orientation in Fortran” and can be read at your leisure. You should also read the Fortran 90 section of the Babel Users' Guide [http://www.llnl.gov/CASC/components/docs/users_guide/users_guide.html].

There are other limitations of the Fortran 90 standard that Babel deals with by adhering to certain conventions:

- Fortran doesn't offer the hierarchical structures for routine and type names in the way that most OO languages do, so SIDL's hierarchical dot-separated notation is translated into a flat namespace using underscores in Fortran. For example, `gov.cca.Services` is translated to gov_cca_Services. A reference to that SIDL interface would be defined as a variable in this fashion:

```
type(gov_cca_Services_t) :: services
```

- Because of the requirement that all symbols in Fortran 90 be at most 32 characters, sometimes long names common in OO programming styles need to be abbreviated. Babel keeps the most significant portion of the name (the base name) and truncates the rest, adding a hash to make it unique if necessary. For example, our own `F90Driver` component's `setServices()` subroutine declaration looks like:

```
recursive subroutine F90Dri_setServices4khxt4z7ds_mi(self, services, &
                                                     exception)
```

1. The next step in implementing the driver is to get Babel to generate the skeleton code that we will fill in with the component's implementation. In the `student-src/components` directory, type **`make .drivers.F90Driver-f90`**. The output should look something like this:

```
### Generating a f90 implementation for the drivers.F90Driver component.
/san/shared/cca/tutorial/bin/babel -s f90 -R../xml_repository \
 -R/san/shared/cca/tutorial/share/cca-spec-babel-0_7_0-babel-0.9.4/xml \
 -g -u -E -l -m drivers.F90Driver. --suppress-timestamp drivers.F90Driver
Babel: Resolved symbol "drivers.F90Driver"...
```

```
touch .drivers.F90Driver-f90
```

and in the `student-src/components/drivers/f90` directory, you should see the following files:

```
drivers.F90Driver.babel.make
drivers_F90Driver_Impl.F90
drivers_F90Driver_Mod.F90
glue
```

all of which were generated by Babel. (`glue` is actually a directory that contains a large number of generated files that Babel needs to do its job, but which you never need to modify.) The source code files that you will need to modify in order to implement the component are the so-called `Impl` files. For Fortran 90, both a source file (`_Impl.F90`) and the corresponding module file (`_Mod.F90`) are generated.

2. In your editor, take a look through both `student-src/components/drivers/f90/drivers_F90Driver_Impl.F90` and `student-src/components/drivers/c++/drivers_F90Driver_Mod.F90` to familiarize yourself with their structure before you make any changes.

   a. When an automatically generated file is manually modified, there is always a danger that the modifications will be overwritten the next time the file is generated. Babel solves this with a concept called *splicer blocks*. These structured comments that appear to the compiler as regular comments, but are interpreted by Babel as having a special meaning. Babel will preserve code *within* a splicer block when the file is regenerated. Code outside splicer blocks will be overwritten. Most Babel-generated files contain numerous splicer blocks -- everywhere you might need to add something to the generated skeleton. Here is an example:

      ```
      ...
      ! DO-NOT-DELETE splicer.begin(drivers.F90Driver.use)
      ! Insert use statements here...
      ! DO-NOT-DELETE splicer.end(drivers.F90Driver.use)
      ...
      ```

      Note that each splicer block has a name that is unique within the file, and has explicit beginning and end markers. In this case, the leading comment syntax is appropriate to Fortran 90, but of course files generated for other languages will have different ways of denoting comments.

   b. In the `drivers_F90Driver_Impl.F90`, You will see that Babel has already generated the signatures for all of the methods you need to implement, giving them appropriate names that conform to the Fortran 90 standard (including being hashed to remain within the 32 character limit if necessary), however it should be fairly easy to match them up with corresponding SIDL names. In this case, both the `go` method inherited from the `gov.cca.ports.GoPort` definition, and the `setServices` method inherited from the `gov.cca.Component` definition are there, along with several others associated with Babel.

3.3.1. The `setServices` Implementation

1. We'll begin by implementing the `setServices` method in `drivers_F90Driver_Impl.F90`. Here is what the routine should look like (you'll need to type in the stuff marked up **`like this`**), along with some comments about different sections.

```
...
!
! Method:  setServices[]
!

recursive subroutine F90Dri_setServices4khxt4z7ds_mi(self, services, &
  exception)
  use sidl_BaseInterface
  use drivers_F90Driver
  use gov_cca_Services
  use gov_cca_CCAException
  use drivers_F90Driver_impl
  ! DO-NOT-DELETE splicer.begin(drivers.F90Driver.setServices.use)
  ! Insert use statements here...

  use gov_cca_TypeMap      ! A CCA catch-all properties list (empty for us)
  use gov_cca_Port         ! needed to use a gov.cca.Port (we do)
  use gov_cca_ports_GoPort ! need to export our implementation of GoPort

  ! DO-NOT-DELETE splicer.end(drivers.F90Driver.setServices.use)
  implicit none
  type(drivers_F90Driver_t) :: self ! in
  type(gov_cca_Services_t) :: services ! in
  type(sidl_BaseInterface_t) :: exception ! out

! DO-NOT-DELETE splicer.begin(drivers.F90Driver.setServices)
! Insert the implementation here...

  type(gov_cca_TypeMap_t)    :: myTypeMap (1)
  type(gov_cca_Port_t)       :: myPort
  type(SIDL_BaseInterface_t) :: excpt
  type(drivers_F90Driver_wrap) :: dp

  call drivers_F90Driver__get_data_m(self, dp) (2)

  ! Set my reference to the services handle
  dp%d_private_data%frameworkServices = services (3)

  call addRef(services)

  ! Create an empty TypeMap
  call createTypeMap(dp%d_private_data%frameworkServices, & (4)
                     myTypeMap, excpt)
  call checkExceptionDriver(excpt, 'setServices createTypeMap call')

  ! Provide a GoPort
  call cast(self, myPort) (2)

  call addProvidesPort(dp%d_private_data%frameworkServices, & (2)
                       myPort, 'GoPort', 'gov.cca.GoPort',  &
                       myTypeMap, excpt)
  call checkExceptionDriver(excpt,'setServices addProvidesPort: GoPort' )

  ! Register to use an integrator port
  call registerUsesPort(dp%d_private_data%frameworkServices, & (5)
```

```
      'IntegratorPort',                                    &
      'integrator.Integrator',                             &
      myTypeMap, excpt)
  call checkExceptionDriver(excpt, &
      'setServices registerUsesPort: IntegratorPort')

  call deleteRef(myTypeMap) (4)
! DO-NOT-DELETE splicer.end(drivers.F90Driver.setServices)
end subroutine F90Dri_setServices4khxt4z7ds_mi
...
```

(1) Declaration of variables that will be needed below. The types are defined in various modules used above. The drivers_F90Driver_wrap type is a Babel idiom for the private data associated with the particular *instance* of this component, in an object-oriented sense.

(3) When the framework calls `setServices`, it passes in a gov.cca.Services object (in C++ gov::cca::Services) that we need to keep a copy of in the private data associated with this instance of our component. Babel uses "reference counting" to track usage of objects in order to know when it is safe to delete them. Because Fortran has no native mechanism for reference counting, we must use Babel's `addRef` method to indicate that we're storing a reference to the `services` object that the framework passed in to `setServices`

(4) The `services` methods to register *uses* and *provides* ports requires a gov.cca.TypeMap (in Fortran TypeMap), which we create here.

In SIDL, methods can throw exceptions. In languages like Fortran, which don't have native support for exceptions (if you're not familiar with exceptions, it is sufficient to think of them as error codes), they are translated into an additional subroutine argument (in this case `excpt`) which then should be checked ("caught"). We'll add the `checkExceptionDriver` method in Step 2.

When Babel creates `myTypeMap`, it will (internally) add a reference to it. Once we're done using it, we can tell Babel that by calling Babel's `deleteRef` method, which you can see at the end of the routine. When the reference count goes to zero, Babel will destroy the `myTypeRef` object and reclaim the memory associated with it.

Caution

Failure to follow proper reference counting procedures in Babel/Fortran (or other non-OO languages, such as C) code will lead to "memory leaks" in your application. See the Babel Users' Guide [http://www.llnl.gov/CASC/components/docs/users_guide/users_guide.html] for more detailed information.

(2) In order to register the ports that our component will provide with the framework, we use the `addProvidesPort` method of the `gov.cca.Services` interface. You can find this interface in the `cca.sidl` file (where you previously looked up `gov.cca.Component` and `gov.cca.ports.GoPort`) in order to check its signature, which is:

```
...
void addProvidesPort(in gov.cca.Port inPort,
                     in string portName,
                     in string type,
                     in gov.cca.TypeMap properties )
       throws gov.cca.CCAException ;
...
```

(Of course we're actually calling the Fortran 90 version of the interface.)

The first argument is the object that actually provides the port. The way we wrote the SIDL, the `drivers.F90Driver` class provides the port, and since we're writing a method within this class, we use Babel's `cast` method to cast our self pointer to type gov.cca.Port.

The second and third arguments are a local name for the port, which must be unique within the component, and a type, which *should* be globally unique. If the actual types of the ports don't match between *user* and *provider*, it will cause a failed cast or possibly a segmentation fault. The string type here is a convenience to the user, giving a human-readable way to identify the type of the port that can be presented in the framework's user interface. By convention, the SIDL interface name for the port is used for the type.

The final argument is a `gov.cca.TypeMap`. This is a CCA-defined type that provides a simple hash table that can be used to associate properties with a *provides* port. In practice, it is rarely used, but must be present.

5. We must also tell the framework which ports we expect to *use* from other components. Looking in `cca.sidl`, we find that the method's signature is:

```
...
void registerUsesPort(in string portName,
                      in string type,
                      in gov.cca.TypeMap properties )
     throws gov.cca.CCAException ;
...
```

The first and second arguments are a local name for the port, following the same rules and conventions as in the `addProvidesPort` invocation above. The final argument is, once again, a `gov.cca.TypeMap`, again like `addProvidesPort`.

2. The module file also requires a couple of additions. First, let's take care of declaring `framework-Services` as part of the module's private data.

   Edit `student-src/components/drivers/f90/drivers_F90Driver_Mod.F90` and add the following:

```
...
type drivers_F90Driver_priv
  sequence
  ! DO-NOT-DELETE splicer.begin(drivers.F90Driver.private_data)

  ! Handle to framework Services object
  type(gov_cca_Services_t) :: frameworkServices

  ! DO-NOT-DELETE splicer.end(drivers.F90Driver.private_data)
end type drivers_F90Driver_priv
...
```

3. We also need to add the use directives for the module for `gov.cca.Services`.

```
...
! DO-NOT-DELETE splicer.begin(drivers.F90Driver.use)
! Insert use statements here...

! CCA framework services module
  use gov_cca_Services
```

```
! DO-NOT-DELETE splicer.end(drivers.F90Driver.use)
...
```

4. Now, although the component is not complete, it is a good idea to check that it compiles correctly with the code you've added so far.

   First, change directories to `student-src/components` and run **`make drivers`**. This will install `Makefile` and `MakeIncl.user` files in `student-src/components/drivers/f90`.

   Then, change directories to `student-src/components/drivers/f90` and run **`make`**. If you get any compiler errors, you should fix them before going on.

3.3.2. Implementing the Constructor and Destructor

Constructor and *destructor* are concepts from object-oriented programming. Specifically, they are the routines that are called to create an instance of an object, and when it is being destroyed. When using most OO languages in the CCA/Babel environment, the constructor and destructor are handled pretty much automatically. In a non-OO language, like Fortran or C, we have to do a little more work. Specifically, we have to allocate and deallocate the data needed to maintain the private state of the component instance.

1. Edit `student-src/components/drivers/f90/drivers_F90Driver_Impl.F90` and find the constructor method, which Babel abbreviates `ctor`.

   The constructor must allocate the space for the private data, initialize the private data as appropriate (in this case, we set `frameworkServices` to `null`), and Babel has to be told about the private data. In this component, the only private data we need to store is a pointer to the `services` object passed into `setServices`.

```
...
!
! Class constructor called when the class is created.
!

recursive subroutine drivers_F90Driver__ctor_mi(self)
  use drivers_F90Driver
  use drivers_F90Driver_impl
  ! DO-NOT-DELETE splicer.begin(drivers.F90Driver._ctor.use)
  ! Insert use statements here...
  ! DO-NOT-DELETE splicer.end(drivers.F90Driver._ctor.use)
  implicit none
  type(drivers_F90Driver_t) :: self ! in

! DO-NOT-DELETE splicer.begin(drivers.F90Driver._ctor)
! Insert the implementation here...

  ! Access private data
  type(drivers_F90Driver_wrap) :: dp
  ! Allocate memory and initialize
  allocate(dp%d_private_data)
  call set_null(dp%d_private_data%frameworkServices)
  call drivers_F90Driver__set_data_m(self, dp)
```

```
! DO-NOT-DELETE splicer.end(drivers.F90Driver._ctor)
end subroutine drivers_F90Driver__ctor_mi
...
```

2. Find the destructor method, which Babel abbreviates `dtor`. The destructor's job is to undo what the constructor did.

```
...
!
! Class destructor called when the class is deleted.
!

recursive subroutine drivers_F90Driver__dtor_mi(self)
  use drivers_F90Driver
  use drivers_F90Driver_impl
  ! DO-NOT-DELETE splicer.begin(drivers.F90Driver._dtor.use)
  ! Insert use statements here...
  ! DO-NOT-DELETE splicer.end(drivers.F90Driver._dtor.use)
  implicit none
  type(drivers_F90Driver_t) :: self ! in

! DO-NOT-DELETE splicer.begin(drivers.F90Driver._dtor)
! Insert the implementation here...

  ! Access private data and deallocate storage
  type(drivers_F90Driver_wrap) :: dp
  call drivers_F90Driver__get_data_m(self, dp)
  deallocate(dp%d_private_data)

! DO-NOT-DELETE splicer.end(drivers.F90Driver._dtor)
end subroutine drivers_F90Driver__dtor_mi
...
```

3. Now, although the component is not complete, it is a good idea to check that it compiles correctly with the code you've added so far. Run **make** in `student-src/components/drivers/f90`. If you get any compiler errors, you should fix them before going on.

3.3.3. The go Implementation

1. Once again, edit `student-src/components/drivers/f90/drivers_F90Driver_Impl.F90` and add the implementation of the `go` method:

```
...
!
! Method:  go[]
!

recursive subroutine drivers_F90Driver_go_mi(self, retval)
  use drivers_F90Driver
  use drivers_F90Driver_impl
```

```
    ! DO-NOT-DELETE splicer.begin(drivers.F90Driver.go.use)
    ! Insert use statements here...

    use sidl_BaseInterface (1)
    use gov_cca_Services
    use gov_cca_Port
    use integrator_IntegratorPort

    ! DO-NOT-DELETE splicer.end(drivers.F90Driver.go.use)
    implicit none
    type(drivers_F90Driver_t) :: self ! in
    integer (selected_int_kind(9)) :: retval ! out

  ! DO-NOT-DELETE splicer.begin(drivers.F90Driver.go)
  ! Insert the implementation here...

    type(gov_cca_Port_t) :: generalPort (2)
    type(SIDL_BaseInterface_t) :: excpt
    type(integrator_IntegratorPort_t) :: integratorPort (2)

    ! Private data reference
    type(drivers_F90Driver_wrap) :: dp

    ! local variables for integration
    real (selected_real_kind(15, 307)) :: lowBound (3)
    real (selected_real_kind(15, 307)) :: upBound
    integer (selected_int_kind(9)) :: count
    real (selected_real_kind(15, 307)) :: value

    ! Initialize local variables
    count = 100000 (3)
    lowBound = 0.0
    upBound = 1.0

    ! Access private data
    call drivers_F90Driver__get_data_m(self, dp)
    retval = -1

    ! get the port ...
    call getPort(dp%d_private_data%frameworkServices, & (2)
         'IntegratorPort', generalPort, excpt)
    call checkExceptionDriver(excpt, & (4)
         'getPort(''IntegratorPort'')')
    if(is_null(generalPort)) then
       write(*,*) 'drivers.F90Driver not connected'
       return
    endif

    ! Get an IntegratorPort reference from the general port one
    call cast(generalPort, integratorPort) (2)

    if (not_null(integratorPort)) then (4)
       value = -1.0 ! nonsense number to confirm it is set

       ! operate on the port
       call integrate(integratorPort, lowBound, upBound, count, & (5)
                      value)
       write(*,*) 'Value = ', value
    else   ! integratorPort is null
```

```
      write(*,*) 'DriverF90: incompatible IntegratorPort'
    endif

    ! release the port
    call releasePort(dp%d_private_data%frameworkServices, & ❻
                     'IntegratorPort', excpt)
    call checkExceptionDriver(excpt, 'releasePort(''IntegratorPort'')')

    retval = 0 ❼
    return

! DO-NOT-DELETE splicer.end(drivers.F90Driver.go)
end subroutine drivers_F90Driver_go_mi
...
```

❶ Declarations for modules we need to use in this routine.
❸ Setup the variables and parameters with which to call the integrator.
❷ These portions of the code are associated with getting a handle to the particular `integrator.IntegratorPort` that the driver's *uses* port has been connected to.

First, we have to declare variables of the appropriate type to hold the port. Because of the way OO programming works in CCA/Babel, we first get the port as a generic gov.cca.Port (gov_cca_Port_t in Fortran 90) and then cast it to the specific port we need to use, integrator.IntegratorPort (integrator_IntegratorPort_t in Fortran 90). Recall that `integrator.IntegratorPort` is defined in `student-src/ports/sidl/integrator.sidl`).

Then, we invoke the `getPort` on our `frameworkServices` object. The argument to this method is the local name we used in the `registerUsesPort` invocation, and it returns a gov.cca.Port (and an exception).

Finally, we use Babel's `cast` method to cast the generic port to the specific integrator port that we need.

❹ This code checks that the `getPort` worked, and returned a valid port. If the `getPort` fails, or if the driver's *uses* port has not been connected to an appropriate *provider*, then `getPort` will return a null port object. The `is_null` method is automatically available on the Fortran 90 binding of any SIDL object. Because the driver can't do anything without being properly connected to an integrator, the response to `getPort` failing is to abort by returning a non-zero value.

It is also possible that a valid gov.cca.Port would be returned, but it might not be the integrator.IntegratorPort we expect. If this is the case, the `cast` will return a null value. The proper action in this case is also to fail gracefully by returning a non-zero result.

Note

`getPort` returning nil need not be treated as a fatal error in all cases. For example, a component may be designed so that certain ports are optional -- to be used if present, but to be ignored if not. Another possibility is that the component may be able to accomplish the same thing through several different ports, so that only one of a given group needs to be connected.

❺ Here we actually call the `integrate` method on the `integrator` port we just got a handle for. The signature of the `integrate` method is defined in `student-src/ports/sidl/integrator.sidl`. Notice that while the SIDL definition of `integrate` shows it as a function, returning a double precision result, in Fortran 90, Babel translates this into a subroutine with the return value as an extra argument. This is because

Fortran does not support functions returning all types (arrays, for example).

6 Finally, once we're done using the port, we call `releasePort`.

7 It is considered impolite for a component to call `exit` because it will bring down the entire application, and possibly crash the framework. Instead, components should simply return.

2. There's one other bit of code we have to provide before we can declare this component complete. In numerous places, we've seen exceptions being returned, and we've been using a routine `checkExceptionDriver` to deal with them. This is a method that we have to write.

   Exceptions are a potentially powerful and sophisticated way of handling errors in software. But for the purposes of this exercise, we're going to take a very simple approach. Our *exception handler* routine simply test whether or not the exception is a null object, and if it is print a message and tell Babel that as far as we're concerned it can delete the `excpt` object. Notice that this routine does *not* exit or abort. As we've noted, it is not considered polite behavior for a component to exit, even in the event of an exception.

   In `student-src/components/drivers/f90/drivers_F90Driver_Impl.F90` locate the splicer blocks for miscellaneous code, at the very end of the file, and enter the following:

```
...
! DO-NOT-DELETE splicer.begin(_miscellaneous_code_end)
! Insert extra code here...!
! Small routine (not part of the SIDL interface) for
! checking the exception and printing the message passed as
! and argument
!
subroutine checkExceptionDriver(excpt, msg)
  use SIDL_BaseInterface
  use gov_cca_CCAException
  implicit none
  type(sidl_BaseInterface_t), intent(inout) :: excpt
  character (len=*) :: msg ! in
  if (not_null(excpt)) then
      write(*, *) 'drivers.F90Driver Exception: ', msg
      call deleteRef(excpt)
  end if
end subroutine checkExceptionDriver

! DO-NOT-DELETE splicer.end(_miscellaneous_code_end)
...
```

3. Congratulations, you have completed the implementation of the `F90Driver`! To check your work, run **`make`** in `student-src/components/drivers/f90`. If you get any compiler errors, you should fix them before going on.

4. At this point, it is a good idea to go up to `student-src` and run **`make`** to insure that anything else which might depend on the existence of the new `drivers.CXXDriver` component gets built too.

The next step is to test your new driver component, in Section 3.5, “Using Your New Component”.

3.4. SIDL and CCA Object Orientation in Fortran

There will be a few artifacts of CCA's(and Babel's) insistence on an object model. Generally the object oriented style of programming groups *state* data and subroutines (or methods) into "objects". Because CCA requires an object model for its components, Fortran programmers will have to become a little familiar with how CCA/Babel implements this in the language. A broad exposition on object oriented concepts is beyond the scope of this tutorial document, more and better information can be found elsewhere [http://en.wikipedia.org/wiki/Object_oriented_programming].

The first thing objects need is a constructor and destructor to initialize state data. For Fortran, the methods ending in `_ctor` and `_dtor` are the constructor and destructor for the component (see listing above). This allows the programmer to create (in the constructor) and delete (in the destructor) state data associated with the component. One thing that almost all components want to store is the `gov_cca_Services` handle that is passed in through the `setServices()`. A complex component may wish to store parameters associated with its function as well.

Looking at the cca specification `cca.sidl`, Babel maps each CCA SIDL type (e.g. `gov.cca.Port`) to a Fortran type (e.g. type(gov_cca_Port_t)).

Because return values cannot accept all Babel types and because Fortran does not provide either an object model or a mechanism for exceptions, these features are placed in the argument list:

- A handle that represents the component and holds the state (or private) data for the component is prepended to the *front* of the argument list for every subroutine method: it is usually called `self`.
- The return value is appended to the *end* of the argument list.
- If there is an exception specified in the `.sidl` file, then the exception (of type SIDL_BaseInterface_t) is appended *after* the return value.

As an example, if a user specifies a SIDL snippet such as:

```
file: ./cca-spec-babel/cca.sidl line:108
package gov {
package cca version 0.7.0 {
...
        Port getPort(in string portName) throws CCAException;
...
} // end of package cca
} // end package gov
```

In Fortran translates into:

```
...
type(gov_cca_Port_t) :: port
type(SIDL_BaseInterface_t) :: excpt
type(gov_cca_Services) :: frameworkServices
...
port = getPort(frameworkServices, port, excpt)
```

3.5. Using Your New Component

1. Change directories to `student-src/components/examples` and edit `task1_rc`. This file will assemble and run an application using the new driver component you've created. However it

includes lines for both versions of the driver component, and probably you've only implemented one. So you will need to comment out all of the lines which refer to the driver component you did *not* implement.

2. Run the script with **`ccafe-single --ccafe-rc task1_rc`**. It should run without errors and give you a result like `Value = 3.140347` (since we're using a Monte Carlo integration algorithm, results will vary).

3. Feel free to modify `task3_rc` to assemble applications with different components. The beginning of the `rc` file loads the palette with all of the available components and creates an instance of each. See Chapter 2, *Assembling and Running a CCA Application* for further information and ideas for other “applications” you can construct.

Chapter 4. Creating a Component from an Existing Library

$Revision: 1.36 $
$Date: 2004/10/10 21:10:08 $

In this exercise, you will wrap an existing ("legacy") software library as a CCA component (i.e. "componentize" it). The CCA is designed to make it as easy as possible to componentize existing software, and a significant fraction of CCA components are created in this way. While this specific example is minimal, the techniques used to produce a component that uses an existing library with minimal or no modifications to legacy code is applicable for large legacy codes.

The integrator components are Fortran90 wrappers over an existing legacy integrator library. For the purposes of this exercise, the legacy library is located in the `student-src/legacy/f90` directory. The `Integrator.f90` code implements a midpoint rule integration approach. Our goal is to create an integrator component that uses the legacy implementation to compute the integral of a function.

4.1. The legacy Fortran integrator

Our Fortran legacy library (in `student-src/legacy/f90`) contains an integration algorithm, which can be invoked as follows:

```
    call integrate_mp(functionParams, lowBound, upBound, count)
```

where functionParams is a variable of type FunctionParams_t. This type is used to store various function-specific attributes, such as the constant coefficients. The definition of this type is in the `FunctionModule` module, in the `LegacyFunctionModule.f90` file:

file: student-src/legacy/f90/LegacyFunctionModule.f90

```
module FunctionModule
  implicit none

  type FunctionParams_t
     private
     real, dimension(3) :: coef
  end type FunctionParams_t

contains

  subroutine init(params, coefficients)
    ! !INPUT PARAMETERS:
    type(FunctionParams_t), intent(INOUT) :: params
    real, dimension(:), intent(IN) :: coefficients

    integer :: i

    do i = 1 ,3
       params%coef(i) = coefficients(i)
    end do

  end subroutine init

  real function eval(params, x)

    ! !INPUT PARAMETERS:
    type(FunctionParams_t), intent(IN) :: params
```

```
    real, intent(IN)                    :: x

    eval = 2 * x

  end function eval

end module FunctionModule
```

The legacy integrator (in `Integrator.f90`) uses the midpoint integration algorithm to integrate an arbitrary function that has an `eval` function and uses FunctionParams_t to store its state. The complete code for the legacy integrator follows.

file: student-src/legacy/f90/Integrator.f90

```
module Integrator
  use FunctionModule                                                    ❶
  implicit none

contains

  real function integrate_mp(functionParams, lowBound, upBound, count)
    implicit none

    ! !INPUT PARAMETERS:

    type(FunctionParams_t),intent(IN) :: functionParams                 ❷
    real,                  intent(IN) :: lowBound
    real,                  intent(IN) :: upBound
    integer,               intent(IN) :: count

    ! !LOCAL VARIABLES:
    real :: sum, h, x, dcount, func_val
    integer :: i

    integrate_mp = -1

    ! Compute integral
    sum = 0.0
    h = (upBound - lowBound) / count

    do i = 0, count
       x = lowBound + h * (i + 0.5)
       func_val = eval(functionParams, x)                               ❸
       sum = sum + func_val
    end do

    integrate_mp = sum * h

  end function integrate_mp

end module Integrator
```

Notes on the `Integrator.f90` file

❶ The `Integrator` module uses the `FunctionModule`, which means that the integrator can only evaluate functions defined in this `FunctionModule`, or other Fortran modules that "extend" it.

❷ The `functionParams`argument of the integrator is the only way function parameters can be passed through to the function being evaluated.

❸ This evaluates the function given the parameters passed into the `Integrator`.

4.2. The `FunctionModule` wrapper.

To enable the legacy integrator to evaluate functions that are not defined in the same fashion as the `FunctionModule` above (i.e., such that they define the `eval` method or equivalent interface that takes a FunctionParams_t argument and a real argument) is to create another `FunctionModule` that allows a `FunctionPort` to be used for the function evaluation.

file: student-src/legacy/f90/FunctionModuleWrapper.f90

```
module FunctionModule

  ! This module replaces the FunctionModule used by the legacy integrator.
  ! Thus, we need to makes sure that this module is first in the module
  ! search path when building the integrator component.

  ! We need to include the function port definitions
  use function_FunctionPort_type                                    ❶
  use function_FunctionPort

  implicit none

  type FunctionParams_t
     sequence              ! required for component version
     type(function_FunctionPort_t) funcPort                         ❷
  end type FunctionParams_t

  interface eval                                                    ❸
     ! This is the one called by the legacy Integrator
     module procedure evalFunction
  end interface

contains

  subroutine setFunctionPort(params, port)
    type(FunctionParams_t),        intent(OUT) :: params
    type(function_FunctionPort_t), intent(IN)  :: port

    params%funcPort = port
  end subroutine setFunctionPort

  real function evalFunction(params, x)
    use function_FunctionPort
    ! input parameters:
    type(FunctionParams_t), intent(IN) :: params
    real,                   intent(IN) :: x

    ! local variablesreal
    real (selected_real_kind(15, 307)) :: xx
    real (selected_real_kind(15, 307)) :: retval

    ! Compute value by calling the function evaluation in FunctionModule
    xx = x
    call evaluate(params%funcPort, xx, retval)                      ❹
    evalFunction = retval

  end function evalFunction

end module FunctionModule
```

Notes on the `FunctionModuleWrapper.f90` file

1. The `FunctionModuleWrapper` module uses (includes) the `FunctionPort_type` and `FunctionPort` modules (in `student-src/ports/function/f90`, whose definitions were automatically generated by Babel from the SIDL definition of `function.FunctionPort` (`student-src/ports/sidl/function.sidl`).
2. The FunctionParams_t type that was originally defined in LegacyFunctionModule.f90.
3. The legacy `FunctionModule` contained the `eval` function; in our wrapper implementation, we create an `eval` interface that contains the new evaluation function, `evalFunction`.
4. This is the call to the `evaluate` subroutine of the `FunctionPort`, using the parameters passed to the `evalFunction`. Note that the `params%funcPort` is supposed to have already been set by the caller by using the `setFunctionPort` subroutine defined in this module.

Note

In one of the first steps of this tutorial, the entire tutorial tree was built (see Appendix C, *Building the Tutorial and Student Code Trees*), including the sources in the `student-src/legacy/f90` directory and its subdirectories. Two distinct libraries were created, one containing only legacy codes (`lib/libLegacyIntegrator.a`), and another one (`lib/libWrappedLegacyIntegrator.a`) containing the `FunctionModule` definition in `FunctionModuleWrapper.f90` instead of the `FunctionModule` definition definition contained in `LegacyFunctionModule.f90`. Also, the compiled modules for each version (legacy and wrapped) are put in separate include directories: `include` for the legacy code, and `include_w` for the wrapped version. While the simple application example (in `simpleApp/Main.f90`) uses only the legacy codes, the `include_w` directory and the `lib/libWrappedLegacyIntegrator.a` are used in the compilation of the Midpoint integrator component that you will write in the steps that follow.

4.3. Implementing the `integrators.Midpoint` component

The `integrator.IntegratorPort` definition

The file `student-src/ports/sidl/integrator.sidl` already contains the `integrator.IntegratorPort` SIDL declaration:

```
package integrator version 1.0 {

  interface IntegratorPort extends gov.cca.Port
  {
    double integrate(in double lowBound, in double upBound,
                     in int count);
  }

}
```

The `integrator.IntegratorPort` SIDL interface extends the `gov.cca.Port` interface, which does not have any methods. Thus, the only method in the `integrator.IntegratorPort` is `integrate`, which takes several arguments that determine the region of integration and the number of points at which the function is evaluated.

4.4. SIDL definition of the Midpoint component

1. We will write a SIDL-based component that implements the port defined in previous steps and calls the `integrate_mp` method implemented in the legacy code described in Section 4.1, “The legacy Fortran integrator” to integrate a function, using function components that implement the `function.FunctionPort` port described in The integrator.IntegratorPort definition.

   Edit the file, `student-src/components/sidl/integrators.sidl` to define the class for the new integrator component, `integrators.Midpoint`:

```
package integrators version 1.0 {

  // The following components implement all methods of the
  // integrator.IntegratorPort and gov.cca.Component interfaces.
  // Since they use the SIDL 'implements-all' keyword, the
  // methods do not need to (but optionally can) be listed explicitly.

  class Midpoint implements-all integrator.IntegratorPort,
                                gov.cca.Component
  {
  }

  class MonteCarlo implements-all integrator.IntegratorPort,
                                   gov.cca.Component
                                   gov.cca.ComponentRelease
  {
    // integrator.IntegratorPort methods:
    double integrate(in double lowBound, in double upBound,
                     in int count);

    // gov.cca.Component methods:
    void setServices(in gov.cca.Services services)
                    throws gov.cca.CCAException;

    // gov.cca.ComponentRelease methods:
    void releaseServices(in gov.cca.Services services)
                        throws gov.cca.CCAException;
  }
}
```

   Note that the `Midpoint` class, unlike the `MonteCarlo` class does not implement the `gov.cca.ComponentRelease` interface, which is optional.

2. Edit the file `student-src/components/MakeIncl.components` to add a new component description in the COMPONENTS variable, which contains the list of components in this directory. Each value consists of the fully-qualified name of the component (including packages), to which we append "-language", where language is one of c, c++, or f90. In this case, the name is `integrators.Midpoint`, and the language is f90, so you need to add **`integrators.Midpoint-f90`**. The updated value of COMPONENTS should look like something like this:

```
COMPONENTS = functions.PiFunction-c++ \
        integrators.MonteCarlo-f90 randomgens.RandNumGenerator-c++ \
        drivers.F90Driver-f90 drivers.CXXDriver-c++  \
        integrators.Midpoint-f90
```

   Note the backslash (“\”) that has to be added in order to extend the entry to the next line.

3. In the `student-src/components` directory, run **`make .repository`**. This will generate the XML representation of the `integrator.Midpoint` SIDL class and store it in the `stu-`

dent-src/xml_repository directory.

4. In the student-src/components directory, run **make .integrators.Midpoint-f90**. This will generate Fortran 90 server code for the integrators.Midpoint component class.

4.5. Fortran 90 implementation of the Midpoint integrator

4.5.1. The Midpoint module implementation

- After the Fortran 90 code has been generated by Babel, in student-src/components/integrators/f90, edit the Fortran module definition to define data that will be stored in each instance of this component:

file: student-src/components/integrators/f90/integrators_Midpoint_Mod.F90

```
#include"integrators_Midpoint_fAbbrev.h"
module integrators_Midpoint_impl

! DO-NOT-DELETE splicer.begin(integrators.Midpoint.use)
! Insert use statements here...

! CCA framework services module
use gov_cca_Services

! Use a "wrapper" module for the legacy FunctionModule module
use FunctionModule                                              (1)

! Use legacy Integrator module
use Integrator                                                  (2)

! DO-NOT-DELETE splicer.end(integrators.Midpoint.use)

type integrators_Midpoint_priv
  sequence
  ! DO-NOT-DELETE splicer.begin(integrators.Midpoint.private_data)

  ! Handle to framework Services object
  type(gov_cca_Services_t) :: frameworkServices                 (3)

  ! Function parameters (required by legacy integrator)
  type(FunctionParams_t) :: funcParams                          (4)

  ! DO-NOT-DELETE splicer.end(integrators.Midpoint.private_data)
end type integrators_Midpoint_priv

type integrators_Midpoint_wrap
  sequence
  type(integrators_Midpoint_priv), pointer :: d_private_data
end type integrators_Midpoint_wrap

end module integrators_Midpoint_impl
```

Notes on the `integrators_Midpoint_Mod.F90` file

1. The `integrators_Midpoint` module uses the FunctionModule, which means that the integrator can only evaluate functions defined in this FunctionModule, or other Fortran modules that "extend" it.
3. This component stores a handle to the framework's Services object, equivalently to the way the Driver component was implemented in Step 2.
2. The legacy `Integrator` module is included.
4. The `integrators.Midpoint` component, like the legacy integrator (see Integrator.f90) requires that the function whose integral is to be computed provides its state via the Function-Params_t type.

4.5.2. Defining the constructor and destructor

In the same directory (`student-src/components/integrators/f90`), edit the `integrators_Midpoint_Impl.F90` and insert the code between splicer blocks of the `integrators_Midpoint__ctor_mi`, `integrators_Midpoint__dtor_mi`, and `setServices` subroutines:

file: student-src/components/integrators/f90/integrators_Midpoint_Impl.F90

```
...

!
! Class constructor called when the class is created.
!

recursive subroutine integrators_Midpoint__ctor_mi(self)
  use integrators_Midpoint
  use integrators_Midpoint_impl
  ! DO-NOT-DELETE splicer.begin(integrators.Midpoint._ctor.use)
  ! Insert use statements here...
  ! DO-NOT-DELETE splicer.end(integrators.Midpoint._ctor.use)
  implicit none
  type(integrators_Midpoint_t) :: self ! in

! DO-NOT-DELETE splicer.begin(integrators.Midpoint._ctor)
! Insert the implementation here...

  ! Access private data
  type(integrators_Midpoint_wrap) :: dp
  ! Allocate memory and initialize
  allocate(dp%d_private_data)
  call set_null(dp%d_private_data%frameworkServices)
  call integrators_Midpoint__set_data_m(self, dp)

! DO-NOT-DELETE splicer.end(integrators.Midpoint._ctor)
end subroutine integrators_Midpoint__ctor_mi

!
! Class destructor called when the class is deleted.
!

recursive subroutine integrators_Midpoint__dtor_mi(self)
  use integrators_Midpoint
```

```
  use integrators_Midpoint_impl
  ! DO-NOT-DELETE splicer.begin(integrators.Midpoint._dtor.use)
  ! Insert use statements here...
  ! DO-NOT-DELETE splicer.end(integrators.Midpoint._dtor.use)
  implicit none
  type(integrators_Midpoint_t) :: self ! in

! DO-NOT-DELETE splicer.begin(integrators.Midpoint._dtor)
! Insert the implementation here...

  ! Access private data and deallocate storage
  type(integrators_Midpoint_wrap) :: dp
  call integrators_Midpoint__get_data_m(self, dp)

  ! Decrement reference count for framework services handle
  if (not_null(dp%d_private_data%frameworkServices)) then
     call deleteRef(dp%d_private_data%frameworkServices)
  end if

  deallocate(dp%d_private_data)

! DO-NOT-DELETE splicer.end(integrators.Midpoint._dtor)
end subroutine integrators_Midpoint__dtor_mi
```

4.5.3. The `setServices` implementation

In this step we continue to edit the `student-src/components/integrators/f90/integrators_Midpoint_Impl.F90` file, adding the implementation of the `setServices` subroutine, which is part of the `gov.cca.Component`. Note that in order to accommodate identifier length restriction in Fortran (31 characters), the name of the subroutine was automatically shortened by Babel. The unmangled name is always visible in the comment preceding the subroutine in the Fortran generated code.

```
...
recursive subroutine Midpoi_setServices6_m9htaw4m_mi(self, services,          &
  exception)
  use sidl_BaseInterface
  use integrators_Midpoint
  use gov_cca_Services
  use gov_cca_CCAException
  use integrators_Midpoint_impl
  ! DO-NOT-DELETE splicer.begin(integrators.Midpoint.setServices.use)
  ! Insert use statements here...

  use gov_cca_TypeMap
  use gov_cca_Port
  use SIDL_BaseInterface

  ! DO-NOT-DELETE splicer.end(integrators.Midpoint.setServices.use)
  implicit none
  type(integrators_Midpoint_t) :: self ! in
  type(gov_cca_Services_t) :: services ! in
  type(sidl_BaseInterface_t) :: exception ! out

! DO-NOT-DELETE splicer.begin(integrators.Midpoint.setServices)
! Insert the implementation here...

  type(gov_cca_TypeMap_t)    :: myTypeMap
  type(gov_cca_Port_t)       :: integratorPort
  type(SIDL_BaseInterface_t) :: excpt
  ! Access private data
```

```
  type(integrators_Midpoint_wrap) :: dp
  call integrators_Midpoint__get_data_m(self, dp)

  ! Set my reference to the services handle
  dp%d_private_data%frameworkServices = services

  call addRef(services)

  ! Create a TypeMap with my properties
  call createTypeMap(dp%d_private_data%frameworkServices, myTypeMap, excpt)
  call checkExceptionMid(excpt, 'setServices createTypeMap call')

  call cast(self, integratorPort)

  ! Register my provides port
  call addProvidesPort(dp%d_private_data%frameworkServices, integratorPort, &
                       'IntegratorPort', 'integrator.IntegratorPort', &
                       myTypeMap, excpt)
  call checkExceptionMid(excpt, 'setServices addProvidesPort: IntegratorPort')

  ! The ports I use
  call registerUsesPort(dp%d_private_data%frameworkServices, &
                          'FunctionPort', 'function.FunctionPort', &
                          myTypeMap, excpt)
  call checkExceptionMid(excpt, 'setServices registerUsesPort: FunctionPort')

  call deleteRef(myTypeMap)

! DO-NOT-DELETE splicer.end(integrators.Midpoint.setServices)
end subroutine Midpoi_setServices6_m9htaw4m_mi
```

4.5.4. The `integrate` implementation

Continuing your edits in the `integrators_Midpoint_Impl.F90` file, fill in the implementation of the `integrator.IntegratorPort` interface component, inserting the call to the legacy integrator in the `integrate` method.

file: student-src/components/integrators/f90/integrators_Midpoint_Impl.F90

```
recursive subroutine Midpoint_integrateekg4n6wqha_mi(self, lowBound, upBound,  &
  count, retval)
  use integrators_Midpoint
  use integrators_Midpoint_impl
  ! DO-NOT-DELETE splicer.begin(integrators.Midpoint.integrate.use)
  ! Insert use statements here...

  use function_FunctionPort
  use randomgen_RandomGeneratorPort
  use gov_cca_Services
  use gov_cca_Port
  use sidl_BaseInterface

  use Integrator        ! Legacy integrator module
  use FunctionModule    ! Legacy function module wrapper

  ! DO-NOT-DELETE splicer.end(integrators.Midpoint.integrate.use)
  implicit none
  type(integrators_Midpoint_t) :: self ! in
  real (selected_real_kind(15, 307)) :: lowBound ! in
  real (selected_real_kind(15, 307)) :: upBound ! in
  integer (selected_int_kind(9)) :: count ! in
  real (selected_real_kind(15, 307)) :: retval ! out
```

```
! DO-NOT-DELETE splicer.begin(integrators.Midpoint.integrate)
! Insert the implementation here...

  type(gov_cca_Port_t) :: generalPort
  type(function_FunctionPort_t) :: functionPort
  type(randomgen_RandomGeneratorPort_t) :: randomPort
  type(SIDL_BaseInterface_t) :: excpt

  ! Legacy types and wrappers:
  type(FunctionParams_t) :: funParams

  ! Private data reference
  type(integrators_Midpoint_wrap) :: dp

  ! Copies of base type arguments to the integrate method
  real :: lbnd, ubnd
  integer :: cnt

  real (selected_real_kind(15, 307)) :: sum, width, x, func
  integer (selected_int_kind(9)) :: i

  ! Access private data
  call integrators_Midpoint__get_data_m(self, dp)
  retval = -1

  if (not_null(dp%d_private_data%frameworkServices)) then

     ! Obtain a handle to a FunctionPort
     call getPort(dp%d_private_data%frameworkServices, &
          'FunctionPort', generalPort, excpt)

     if (is_null(excpt)) then

        call cast(generalPort, functionPort)
        if (not_null(functionPort)) then

           ! Set the function port in the FunctionModule wrapper
           call setFunctionPort(funParams, functionPort)

           ! Invoke legacy integrator algorithm to compute integral
           lbnd = lowBound
           ubnd = upBound
           cnt = count
           retval = integrate_mp(funParams, lbnd, ubnd, cnt)

        else   ! functionPort is null
           write(*,*) 'Exception: Midpoint: incompatible FunctionPort'
        endif

        ! Free ports
        call releasePort(dp%d_private_data%frameworkServices, &
             'FunctionPort', excpt)
        call checkExceptionMid(excpt, 'releasePort(''FunctionPort'')')

     else  ! excpt is not null

        call checkExceptionMid(excpt, 'getPort(''FunctionPort'')')

    endif
  else    ! frameworkServices is null
     write(*,*) 'Error: Midpoint: integrate called before setServices'
  endif

! DO-NOT-DELETE splicer.end(integrators.Midpoint.integrate)
end subroutine Midpoint_integrateekg4n6wqha_mi
```

Finally, in the `integrators_Midpoint_Impl.F90` file, find the very last splicer block (labeled `_miscellaneous_code_end`) and add the following helper subroutine:

file: student-src/components/integrators/f90/integrators_Midpoint_Impl.F90

```
!
! Small routine (not part of the SIDL interface) for
! checking the exception and printing the message passed as
! and argument
!
subroutine checkExceptionMid(excpt, msg)
  use SIDL_BaseInterface
  use gov_cca_CCAException
  implicit none
  type(sidl_BaseInterface_t), intent(inout) :: excpt
  character (len=*) :: msg ! in
  if (not_null(excpt)) then
      write(*, *) 'integrators.Midpoint Exception: ', msg
      call deleteRef(excpt)
  end if
end subroutine checkExceptionMid
```

4.6. Building the Fortran 90 implementation of the `integrators.Midpoint` component.

1. In the `student-src/components/integrators/f90` directory, edit the user-defined settings in `MakeIncl.user` file to specify the include paths and library location of the legacy integrator library.

   file: student-src/components/integrators/f90/MakeIncl.user

   ```
   # Include path directives, including paths to Fortran modules
   INCLUDES = \
     $(CCASPEC_BABEL_F90MFLAG)$(COMPONENT_TOP_DIR)/../legacy/f90/include_w

   # Library paths and names
   LIBS = \
     -L$(COMPONENT_TOP_DIR)/../legacy/f90/lib \
     -lWrappedLegacyIntegrator
   ```

   Note that the `INCLUDES` variable is used by the Fortran compiler to locate compiled module information; since the flag used to specify the search path for modules is not the same in all compilers, we use the variable `CCASPEC_BABEL_F90MFLAG`, which was set during the configuration and installation of Babel and CCA tools. The `COMPONENT_TOP_DIR`variable is set automatically when the component's `Makefile` is generated from the `student-src/components/Makefile_template.server` makefile template.

   Also note that the library specified in the definition of the `LIBS` variable is not the original legacy library, which contained the original definition of `FunctionModule` and FunctionParams_t. The only difference between the legacy library and `libWrappedLegacyIntegrator.a` is that the original `FunctionModule` has been replaced with a new definition of `FunctionModule` in `FunctionModuleWrapper.f90` as described in Section 4.2, “The FunctionModule wrapper.”.

2. In `student-src/components/integrators/f90`, run **`make`**. This will build the dynamic component libraries and generate the `*.cca` files needed to load these libraries and instantiate the

components in the Ccaffeine framework. After a successful build, you should be able to see the `libintegratorsMidpoint-f90.so` and `libintegratorsMidpoint-f90.so.cca` files in the `student-src/components/lib` directory.

Note

In this step, the makefile automatically generated the `.cca` file needed by the Ccaffeine and Babel runtime systems to identify and locate babel components. This file can also be generated manually by executing the following command in the directory `student-src/components/lib`:

```
CCA_TOOLS_ROOT/bin/genSCLCCA.sh cca \
   `pwd`/libintegratorsMidpoint-f90.so integrators.Midpoint \
   integratorsMidpoint dynamic private now \
   > integrators.Midpoint.cca
```

4.7. Using your new `integrators.Midpoint` component

To see the new Midpoint integrator component in action, in student-src/components, run

```
ccafe-single --ccafe-rc examples/task2_rc
```

Feel free to modify `task2_rc` to assemble applications with different components. The beginning of the `rc` file loads the palette with all of the available components and creates an instance of each. See Chapter 2, *Assembling and Running a CCA Application* for further information and ideas for other "applications" you can construct.

The output should look something like this:

```
(3587) CmdLineClientMain.cxx: MPI_Init not called in ccafe-single mode.
(3587) CmdLineClientMain.cxx: Try running with ccafe-single --ccafe-mpi yes , or
(3587) CmdLineClientMain.cxx: try setenv CCAFE_USE_MPI 1 to force MPI_Init.
(3587) my rank: -1, my pid: 3587
my rank: -1, my pid: 3587

Chapter 5. Creating a New Component from Scratch

$Revision: 1.15 $
$Date: 2004/10/10 21:10:08 $

In this exercise, you will put together what you've learned in the previous tasks to create a complete component from scratch. We will add to the list of `function` components by creating one that returns the cube of the argument. The new component class will be named `functions.CubeFunction`, and it will implement the `function.FunctionPort` interface, just as the other function components do. The following procedures will guide you through writing the component in C++, though very little would change for if you wanted to implement it in another Babel-supported language.

5.1. SIDL Component Class Specification

In this step, we will define the `function.CubeFunction` SIDL class and build its xml repository representation

1. Edit the file `student-src/components/sidl/functions.sidl`, and add the definition of the class `CubeFunction` to the package `functions`

```
package functions version 1.0 {

  class LinearFunction implements function.FunctionPort,
                                  gov.cca.Component
  {
    // function.FunctionPort methods:
    double evaluate(in double x);

    // gov.cca.Component methods:
    void setServices(in gov.cca.Services servicesHandle)
                            throws gov.cca.CCAException;
  }

... some definitions skipped ...

  class PiFunction implements-all function.FunctionPort,
                                  gov.cca.Component
  {
  }
  class CubeFunction implements-all function.FunctionPort,
                                    gov.cca.Component
  {
  }

}
```

2. Edit the file `student-src/components/MakeIncl.components` to add a new component description in the COMPONENTS variable, which contains the list of components in this directory. Each value consists of the fully-qualified name of the component (including packages), to which we append "-language", where language is one of c, c++, or f90. In this case, the name is functions.CubeFunction, and the language is c++. The updated value of COMPONENTS should look like this:

```
COMPONENTS = functions.PiFunction-c++ \
        integrators.MonteCarlo-f90 randomgens.RandNumGenerator-c++ \
        drivers.CXXDriver-c++ integrators.Midpoint-f90 \
        functions.CubeFunction-c++
```

Note the backslash ("\") that has to be added in order to extend the entry to the next line.

3. In the `student-src/components` directory, run **`make .repository`**. This will re-generate the XML representation of the SIDL component class definitions (including the newly added class `CubeFunction` and store them in the `student-src/xml_repository` directory.

   The output from this step should look something like this:

```
touch .sidl

### Generate XML for SIDL packages containing component declarations
babel -t xml -R../xml_repository -R/san/shared/cca/tutorial/share/cca-spec-babe
Babel: Parsing URL "file:/.automount/whale/root/san/r1a0l0/elwasifw/handson/com

Babel: Warning: Symbol exists in XML repository: integrators.ParallelMid-v1.0
Babel: Parsing URL "file:/.automount/whale/root/san/r1a0l0/elwasifw/handson/com
Babel: Warning: Symbol exists in XML repository: randomgens.RandNumGenerator-v1
touch .repository
```

5.2. Generating Babel Server Code for the New Component

- In the `student-src/components` directory run **`make .functions.CubeFunction-c++`** to generate the C++ server-side binding for the component class `functions.CubeFunction`. The output from this step should look something like this:

```
### Generate a C++ implementation for the CubeFunction component
babel -s c++ -R../xml_repository -R/home/elwasif/CCA/cca-spec-babel-cvs/share/c
-g -u -E -l -m "functions.CubeFunction." --suppress-timestamp functions.CubeFun
Babel: Resolved symbol "functions.CubeFunction"...
touch .functions.CubeFunction
```

  Upon completion of this step, the directory `student-src/components/functions/c++` should contain two additional files, `functions_CubeFunction_Impl.cc` and `functions_CubeFunction_Impl.hh` which will be edited to provide the implementation of the

newly defined component.

5.3. Implementing the New Component

1. Edit the file `functions_CubeFunction_Impl.hh` in the directory `student-src/components/functions/c++`. You will need to add the declaration for the `gov::cca::Services` object to the `private` object state. This will be done inside the Babel splicer block `functions.CubeFunction._implementation`. We will call this variable `myServices`. Upon completion, this splicer block should look like this:

```
...
    // DO-NOT-DELETE splicer.begin(functions.CubeFunction._implementation)
    // Put additional implementation details here...
    gov::cca::Services    myServices;
    // DO-NOT-DELETE splicer.end(functions.CubeFunction._implementation)
...
```

2. Edit the file `functions_CubeFunction_Impl.cc` in the directory `student-src/components/functions/c++` to provide the implementation details. First, you'll need to edit the body of the `setServices` method (between the Babel splicer blocks `functions.CubeFunction.setServices`). Upon completion, this part of the file should look like this:

```
...
  // DO-NOT-DELETE splicer.begin(functions.CubeFunction.setServices)
  // insert implementation here

    myServices = services;
    gov::cca::TypeMap tm = services.createTypeMap();
    if(tm._is_nil()) {
       fprintf(stderr, "Error:: %s:%d: gov::cca::TypeMap is nil\n",
          __FILE__, __LINE__);
       exit(1);
    }
    gov::cca::Port p = self;      //  Babel required casting
    if(p._is_nil()) {
       fprintf(stderr, "Error:: %s:%d: Error casting self to gov::cca::Port \n"
          __FILE__, __LINE__);
       exit(1);
    }

    services.addProvidesPort(p,
                             "FunctionPort",
                             "function.FunctionPort", tm);

    gov::cca::ComponentRelease cr = self;  //  Babel required casting
    services.registerForRelease(cr);
    return;

  // DO-NOT-DELETE splicer.end(functions.CubeFunction.setServices)
...
```

3. Next you will need to edit the implementation for the method `evaluate` inside the Babel splicer block `functions.CubeFunction.evaluate`. After adding the implementation for this method, the body should look like this

```
...
  // DO-NOT-DELETE splicer.begin(functions.CubeFunction.evaluate)
  // insert implementation here
   return x*x*x;
  // DO-NOT-DELETE splicer.end(functions.CubeFunction.evaluate)
...
```

4. To build the newly written component into a usable library, type **`make`** in the directory `student-src/components/functions/c++`. This will compile, link, and install the new component into a library that is installed in the directory `student-src/components/lib`.

Note

In this step, the makefile automatically generated the `.cca` file needed by the Ccaffeine and Babel runtime systems to identify and locate babel components. This file can also be generated manually by executing the following command in the directory `student-src/components/lib`:

```
CCA_TOOLS_ROOT/bin/genSCLCCA.sh cca \
    `pwd`/libfunctionsCubeFunction-c++.so functions.CubeFunction \
   cubeFunction dynamic private now \
   > functions.CubeFunction.cca
```

5.4. Using Your New Component

1. Change directories to `student-src/components/examples` and edit `task3_rc`. This file will assemble and run an application using all of the new components you've created. However it includes lines for both versions of the driver component, and probably you've only implemented one. So you will need to comment out all of the lines which refer to the driver component you did *not* implement.

2. Run the script with **`ccafe-single --ccafe-rc task3_rc`**. It should run without errors and give you a result of `Value = 0.250010`.

3. Feel free to modify `task3_rc` to assemble applications with different components. The beginning of the `rc` file loads the palette with all of the available components and creates an instance of each. See Chapter 2, *Assembling and Running a CCA Application* for further information and ideas for other “applications” you can construct.

Chapter 6. Using TAU to Monitor the Performance of Components

$Revision: 1.6 $
$Date: 2004/10/09 00:56:46 $

In this exercise, you will use the TAU performance observation tools to automatically generate a *proxy* component that monitors all of the method invocations on a port allowing you to track their performance information. While this approach won't provide all of the performance details of what is going on *inside* each component, it gives you a very simple way to begin analyzing the performance of a CCA-based application in order to identify which components might have performance issues.

We will start by create a proxy component for the `integrator.IntegratorPort`. Note that you only need to have completed Chapter 3, *Sewing CCA Components into an Application: the Driver Component* in order to follow these instructions. Though the proxy will be implemented in C++, it can proxy for components implemented in any language.

Warning

The following instructions assume that you chose to implement the `drivers.CXXDriver` rather than the `drivers.F90Driver`. If you implemented the `drivers.F90Driver`, you will need to edit `task4_rc` to reflect this.

6.1. Creating the Proxy Component

1. Edit the file `student-src/components/sidl/integrators.sidl` and make the following addition:

```
package integrators version 1.0 {

  class MonteCarlo implements integrator.IntegratorPort,
                              gov.cca.Component,
                              gov.cca.ComponentRelease
  {
        // integrator.IntegratorPort methods:
        double integrate(in double lowBound, in double upBound, in int count);

        // gov.cca.Component methods:
        void setServices(in gov.cca.Services services) throws gov.cca.CCAExcept

        // gov.cca.ComponentRelease methods:
        void releaseServices(in gov.cca.Services services) throws gov.cca.CCAEx
  }

class IntegratorProxy implements-all integrator.IntegratorPort,
                                                    gov.cca.Component
  {
  }
}
```

This will give us a new component, called `IntegratorProxy` that implements the `integrator.IntegratorPort`.

2. Edit `student-src/components/MakeIncl.components` and make the following additions:

```
# SIDL files containing component declarations
# For example:
# SIDL_FILES = sidl/drivers.sidl
SIDL_FILES = sidl/functions.sidl sidl/integrators.sidl sidl/randomgens.sidl \
             sidl/drivers.sidl

# The COMPONENTS list contains the fully-qualified names of the component
# classes, augmented with -LANGUAGE, where LANGUAGE is the language
# in which the component is implemented, e.g., c, c++, f90.
# For example:
# COMPONENTS = drivers.F90Driver-f90 drivers.CXXDriver-c++
COMPONENTS = functions.PiFunction-c++ \
        integrators.MonteCarlo-f90 randomgens.RandNumGenerator-c++ \
        drivers.CXXDriver-c++ integrators.IntegratorProxy-c++
```

3. In the `student-src/components` directory, type **`make .integrators.IntegratorProxy-c++`** to rebuild the repository. The output should look something like this:

```
### Generating XML for SIDL packages containing component declarations
/san/shared/cca/tutorial/bin/babel -t xml -R../xml_repository \
    -R/san/shared/cca/tutorial/share/cca-spec-babel-0_7_0-babel-0.9.4/xml \
    -o ../xml_repository sidl/functions.sidl sidl/integrators.sidl \
    sidl/randomgens.sidl sidl/drivers.sidl
Babel: Parsing URL "file:/.automount/whale/root/san/r1a010/bernhold/\
  student-src/components/sidl/functions.sidl"...
Babel: Warning: Symbol exists in XML repository: \
       functions.LinearFunction-v1.0
Babel: Warning: Symbol exists in XML repository: \
       functions.NonlinearFunction-v1.0
Babel: Warning: Symbol exists in XML repository: \
       functions.PiFunction-v1.0

    component.
/san/shared/cca/tutorial/bin/babel -s c++ -R../xml_repository \
    -R/san/shared/cca/tutorial/share/cca-spec-babel-0_7_0-babel-0.9.4/xml \
    -g -u -E -l -m integrators.IntegratorProxy. --suppress-timestamp \
    integrators.IntegratorProxy
Babel: Resolved symbol "integrators.IntegratorProxy"...
touch .integrators.IntegratorProxy-c++
```

6.2. Using the proxy generator

1. In the `student-src/components/integrators/c++` directory, type **`tau_babel_pg integrators_IntegratorProxy_Impl.cc -h integrator_IntegratorPort.hh -p IntegratorPort -t integrator.IntegratorPort`**

   The usage of the proxy generator is as follows:

   ```
   Usage: tau_babel_pg <filename> -h <header file> -p <port name> -t <port type> [
   ```

   The `-h` option specifies the header file that needs to be included to use the port. Note that this is the same header file that was added to the `drivers.CXXDriver` component in order to use the `integrator.IntegratorPort`.

   The `-p` option specifies the name of the port. The generated proxy will have two ports named with the port name given appended with “Provide” and “Use” to distinguish them.

   The `-t` option specifies the C++ type of the port. It can be found by examining the appropriate header file.

   The `-f` option forces overwrite of the `_Impl.cc` and file `_Impl.hh` files.

2. Open `integrators_IntegratorProxy_Impl.cc` and look at the code that the proxy generator inserted between the splicer blocks to get a feel for what is really going on.

3. Now build the proxy by going to `student-src` and run **`make`**.

6.3. Using the new proxy component

1. Change directories to `student-src/components/examples` and open `task4_rc`. This file will assemble and run an application using the new proxy component you've created.

   

   Note

   If you installed the cca tools yourself, you will need to modify `task4_rc` to reflect the location of the performance component.

2. Run the script with **`ccafe-single --ccafe-rc task4_rc`**. It should run without errors and give you a result like `Value = 3.140347` as before.

3. Now look in the `student-src/components/examples` directory and you should file a file called `profile.0.0.0`. This file contains profile data for the last run. View it by executing

pprof and you should get output similar to this:

```
Reading Profile files in profile.*

NODE 0;CONTEXT 0;THREAD 0:
---------------------------------------------------------------------------
%Time    Exclusive    Inclusive       #Call      #Subrs  Inclusive Name
              msec   total msec                          usec/call
---------------------------------------------------------------------------
100.0           32           32           1           0      32043 integrate \
                                                  double (double, double, int32_t)
```

Futher exercises: Try swapping in a different integrator. Try generating a proxy for the Function port.

Users are encouraged to visit and read the documentation for TAU available at http://www.cs.uoregon.edu/research/paracomp/tau/tautools/.

Appendix A. Remote Access for the CCA Environment

$Revision: 1.5 $
$Date: 2004/10/10 21:10:08 $

There is really nothing special about using the CCA environment on a remote system compared to any other tools routinely used in technical computing. But there are a few things you can do that might make it more convenient to work remotely. So here are some notes intended to point you to the appropriate places in the manuals for the software you're using.

A.1. Commandline Access

Everything associated with the CCA *can* be done using only commandline access to the remote system. The primary tool for this kind of access at present is the Secure Shell protocol, SSH. Both free and commercial implementations of ssh are widely available. Among the most common are OpenSSH [http://www.openssh.org] for Linux(-like) systems and PuTTY [http://www.chiark.greenend.org.uk/~sgtatham/putty/] for Windows. When we describe specifically how to do something with an SSH client, we will describe it for these two packages. However we won't be using any unusual capabilities of SSH, so most other implementions probably have an equivalent.

A.2. Graphical Access using X11

Your remote CCA environment will be on a Linux(-like) system (because at present, the CCA tools do not run directly on Windows), in which graphical tools (such as text editors, debuggers, performance tools, etc.) typically use the X11 environment. If you wish to use these graphical tools remotely, you'll need an X11 environment on your local system. This is standard on most Linux(-like) systems. On Windows, you will probably have to install an X11 server.

Warning

Running X11 tools remotely can be annoyingly slow, especially over a long-haul connection or a slow network. You may prefer to stick to commandline tools.

Most SSH clients are capable of *forwarding* X11 traffic through your SSH session. If this option is available to you, it is probably the most convenient and definitely the most secure way of running X11 tools remotely. (It is possible for the administrator of the remote system to configure the SSH server to prevent X11 forwarding, but we try to insure that this is not the case on the systems we use for organized tutorials.)

A.2.1. OpenSSH

In most cases, SSH will forward X11 traffic by default, so the simplest thing is to go ahead and try it. To explicitly enable X11 forwarding use the `-X` option to ssh. If you want to disable it for some reason (for instance, it is too slow for your taste and you have a tendency to inadvertently start up graphical tools instead of commandline ones), then use the `-x` option.

A.2.2. PuTTY

In PuTTY, there is a checkbox to Enable X11 forwarding on the Connection->SSH->Tunnels configuration page.

A.3. Tunneling other Connections through SSH

Similar to X11 forwarding, most SSH clients have the ability to *tunnel* other network connections through an SSH session, also known as *port forwarding*. Tunnels connect a port on your local system to a port on a remote system, so that you can make a connection to the port on your local system and, via the tunnel, it will be forwarded to the designated port of the remote system. (Other tunneling setups are possible, but we do not use them in this Guide.) The remote system could be the system you SSH into, or a system *reachable* from the system you SSH into. The two primary uses for tunnels in the context of the CCA are working on clusters where internal nodes don't have direct access to the external network, and making connections through firewalls, for example to run the GUI (of course the firewall must pass the SSH connection that carries the tunnel).

An important thing to note about tunneling is that the port numbers on both ends of the tunnel must be made explicit. Only one application at a time can listen on a port, so port numbers on both ends of the tunnel must be selected to avoid conflicts. Assuming you're the only user on your local system, you must select non-privileged port numbers (1025-65565) that don't conflict with each other, or with any servers or other applications that might already be using ports on your system. In the examples below, we use port 2022 on the `localhost` side of a tunnel for an SSH connection. The same rules apply to the ports on the remote system. If you're sharing the system on which you're running the exercises, you'll need to be sure to select ports not being used by other users. Though statistically, the chances of a collision are relatively small, we avoid such problems in organized tutorials by *assigning* each user a port number to use for the Ccaffeine GUI (in the examples below, we use port 3314). If you're working on your own and are encountering problems finding a free port, the **netstat** (**netstat -a -t -u** on Linux-like systems, or **netstat -a** at the Windows command prompt) can give you a list of the ports currently in use.

A.3.1. Tunneling with OpenSSH

The `-L` *`localPort`*`:`*`remoteHost`*`:`*`remotePort`* option to **ssh** is used to setup tunnels. The following are examples of some tunneling arrangements that might be useful in a CCA context:

- Establishing an SSH connection to the head node of a cluster which will forward SSH connections to an internal node. Then using the tunnel to make a direct connection to the internal node:

```
ssh -L 2022:clusterInternalNode:22 clusterHeadNode
ssh -p 2022 localhost
```

- Establishing an SSH connection to a firewalled machine which will forward connections from the Ccaffeine GUI running locally to the Ccaffeine framework backend running remotely:

```
ssh -L 3314:remoteHost:3314 remoteHost
java -classpath ccafe-gui.jar \
     gov.sandia.ccaffeine.dc.user_iface.BuilderClient \
        --builderPort 3314 --host localhost
```

Tip

Don't worry if you don't understand the details of the java command that invokes the GUI. It is described in more detail in Section 2.3, “Using the GUI Front-End to Ccaffeine”. The key features for this discussion are the `--builderPort 3314 --host localhost` arguments, which tell the GUI to connect to the *local* end of the tunnel.

- Establishing tunnels to an internal node of a cluster for both SSH and Ccaffeine GUI connections:

```
ssh -L 2022:clusterInternalNode:22 \
    -L 3314:clusterInternalNode:3314 clusterHeadNode
```

which can be used precisely as in the preceeding examples.

A.3.2. Tunneling with PuTTY

In PuTTY, tunnels are specified on the Connection->SSH->Tunnels configuration page. To configure a tunnel, you need to go to the Add new forwarded port section of the page. Source port is the port on your local system that you will connect to in order to use the tunnel. In the OpenSSH instructions above, it is labeled *`localPort`* and is the *first* part of the argument of the `-L` option. In PuTTY, the Destination field is *`remotHost`*`:`*`remotePort`*, or the second and third pieces of the OpenSSH `-L` argument. The Local button should always be checked (meaning that the tunnel will be setup to forward from your *local* system to the destination system).

Tip

You might want to take advantage of PuTTY's ability to save “sessions” to save and easily reuse complicated (or tedious) SSH configurations, particularly those including multiple tunnels.

In order to *use* a tunnel once it is setup, you simply enter give the application **`localhost`** and the appropriate port number to connect to. To initiate a tunneled SSH session with PuTTY, you would enter this information in the Session->Host Name and Session->Port fields. In the examples given earlier for OpenSSH (Section A.3.1, “Tunneling with OpenSSH”), a connection to **`localhost`** port **`2022`** would give you an ssh connection to directly to clusterInternalNode. And the Ccaffeine GUI would be invoked in the same way as above (modulo unix vs. Windows details in the command itself).

Appendix B. Building the CCA Tools and TAU, and Setting Up Your Environment

$Revision: 1.13 $
$Date: 2004/10/11 22:27:43 $

The primary tools you'll be using are the Ccaffeine CCA framework [http://www.cca-forum.org/ccafe/] and the Babel language interoperability tool [http://www.llnl.gov/CASC/components/babel.html]. This section provides brief instructions on how to download and install a distribution of these tools (named, creatively enough, “cca-tools”) that has been tested for compatibility with the tutorial code. In Chapter 6, *Using TAU to Monitor the Performance of Components* you will be using the TAU performance observation tools [http://www.cs.uoregon.edu/research/paracomp/tau/tautools/] in conjunction with the CCA, and if you plan to do that exercise, it will be necessary to install TAU on your system as well.

Caution

These tools are still under development as we extend their capabilities. Consequently, it is possible to find numerous releases and snapshots of the individual tools, any given combination of which may not have been tested for compatibility. *Don't use* the individual tool distributions unless you've got a particular reason, usually based on direct conversations with their developers. The latest version of the “cca-tools” package is the recommended distribution for routine use and will provide you with a matched set of tools that will work together properly.

B.1. The CCA Tools

B.1.1. System Requirements

Note

We strongly recommend using a Linux platform to work through these exercises, since this is currently the most extensively tested and most easily supported platform for the CCA tools. If this is not possible, or you have a specific need to use another platform while working through these exercises, please contact us at `<tutorial-wg@cca-forum.org>` to discuss the best way to proceed. We're also interested to hear what platforms you would like to run your CCA applications on in the longer term in order to help us focus our porting and testing efforts.

The requirements to build the CCA tools on Linux platforms are listed below. Requirements for other platforms will vary somewhat.

- gcc >= 3.2
- Java Software Development Kit >= 1.4. The **java** and **javac** commands must be in your execution path.
- Gnome XML C Parser (libxml2) -- most recent Linux distro's already have it, regardless of whether Gnome is installed.

- GNU autobuild tools: anything recent.
- A connection to the internet. (A network connection is required both to download the code cca-tools package and during the build process.)

Additional Optional Software. There are also a number of other packages which are not *required* in order to build the CCA tools, but can be used if present (and may be required in order to obtain certain functionality). If you want to use them, they should be installed before you begin to install the CCA tools.

- MPI: recent versions of MPICH are known to work. At present, the automatic configuration tools do not handle other MPI implementations, and Ccaffeine has not yet been extensively tested against other implementations.

Note

At present, there are no exercises that require MPI.

- Python >= 2.2. If you have multiple versions of Python installed and prefer to have a version in your execution path that does *not* meet the criteria above, you should set the `PYTHON` environment variable to point to a suitable version for the CCA tools prior to configuring them. You can check the python version with **`python -V`**.
- Fortran 90: A variety of Fortran 90 compilers are supported. Because Babel needs to know about the format of the array descriptors used internally by the compiler, the CCA tools will have to be configured with both the path to the compiler and information about which compiler it is. Here is the list of currently supported compilers and the associated labels recognized by the CCA tools configuration script.

Compiler	CCA Tools "VENDOR" Label
Absoft	Absoft
HP Compaq Fortran	Alpha
Cray Fortran	Cray
IBM XL Fortran	IBMXL
Intel v8	Intel
Intel v7	Intel7
Lahey	Lahey
NAG	NAG
SGI MIPS Pro	MIPSpro
SUN Solaris	SUNWspro

You should have the compiler in your execution path, and any relevant `.so` libraries in your `LD_LIBRARY_PATH`. These are required to properly configure the CCA tools package.

B.1.2. Downloading and Building the CCA Tools Package

1. The latest version of the CCA Tools package can be found at ht-

tp://www.cca-forum.org/tutorials/#sources with a filename of the form `cca-tools-`*`version`*`.tar.gz`.

2. Untar the cca-tools tar ball some place that is convenient to build. Look at the README for up to the minute information.

3. Next, you need to run **`./configure`** ***`options`*** on the package. There are numerous configuration options available (type **`./configure --help`** for a complete list). Most languages and tools will be detected automatically as long as they are installed in "reasonable" locations (that is, the common locations the **configure** script is programmed to check). Some of the most commonly used options include:

   - `--prefix=`*`CCA_TOOLS_ROOT`* indicates where the built tools should be installed. *(Default: `./local`, in the build directory.)*
   - `--with-F90-vendor=`*`VENDOR`* (for the brand of compiler, from the table above, *case sensitive*) and `--with-F90=`*`/full/path/to/compiler`* are *both required* to configure a Fortran 90 compiler into the Babel build. *(Default: Fortran 90 will not be used.)*

     For example, using the Intel version 8 compiler installed in the default location, the relevant command would be:

     ```
     ./configure --with-F90-vendor=Intel --with-F90=/opt/intel_fc_80/bin/ifort
     ```

   - If **configure** doesn't find your MPI installation on its own, or finds the wrong on, use the option `--with-mpi=`*`MPI_ROOT`* (such that `MPI_ROOT/bin/mpirun` should exist).

     If an auto-detected MPI installation is causing problems for the build, or you simply don't want to build the tools with MPI support, use `--with-mpi=no`.

     (Default: Auto-detected MPI will be used.)

   - As a fallback, `--with-localsrc` will do a build supporting *only* C, C++, Java, and if the configure script detects it, Python. This option is not meant to be combined with any other **configure** options.

   You should read the output of the configuration process carefully to insure it found all of the tools you wanted it to, and also to be sure it found the particular installation you want to use if there are several for a given tool!

4. Finally, typing **`make`** should build *and install* the tools in the `CCA_TOOLS_ROOT` location you specified in the configuration step.

Caution

Remember that you need to have internet connectivity during the build process! The `Makefile` is designed to download the appropriate versions of additional software it needs, rather than making you do it separately.

The CCA tools build procedure has been tested on a variety of systems with a range of different configuration options, and it works the majority of the time. However it is possible your platform or configuration requirements will confuse it, and it will not build properly for you. If this happens, please contact us

at <tutorial-wg@cca-forum.org> with the output of your attempt to configure and build the package, and any pertinent information about your system. We want to help you get a working CCA environment and improve the packaging of the tools for future users.

B.2. The Ccaffeine GUI

The Ccaffeine front-end GUI is part of the CCA tools distribution you installed above. But if you're running the exercises on a remote system and want to use the GUI (it is *not* required to complete the exercises), you will need to download and setup the GUI on your local system before you can use it. (It will work over an X11 connection to the remote system, if you have one, but we tend to find performance of Java tools like the GUI unacceptable and generally recommend running it locally and connecting to the remote system via an SSH tunnel, as described in Section A.3, "Tunneling other Connections through SSH".)

B.2.1. System Requirements

These requirements apply to both Linux-like and Windows systems.

- Java Software Development Kit >= 1.4. The **java** command must be in your execution path.

B.2.2. Downloading and Setting Up the GUI

1. To use the GUI on your local system, you will need to download the `ccafe-gui.jar` and the convenience script to run it. The script to download depends on which operating system you're local system is running. For Linux-like systems, it is `simple-gui.sh`, and for Windows systems, it is `simple-gui.bat`. The files could be copied (using **scp**) from the CCA tools installation on the remote system (in the *`CCA_TOOLS_ROOT`*`/bin` subdirectory), or (probably more conveniently) downloaded from http://www.cca-forum.org/tutorials/#sources.

2. The scripts expect to be located in the same directory as the `jar` file. Instructions for using the scripts can be found in Section 2.3, "Using the GUI Front-End to Ccaffeine".

B.3. Downloading and Installing TAU

Note

Note that TAU is only needed for Chapter 6, *Using TAU to Monitor the Performance of Components*. If you're not planning to do that exercise, or want to delay installing TAU until then, everything else should work fine without it.

1. The latest version of the TAU Portable Profiling package can be found at http://www.cs.uoregon.edu/research/paracomp/tau/tautools/. Also needed for the exercises requiring TAU is the Performance component, available at http://www.cs.uoregon.edu/research/paracomp/proj/tau/cca/.

2. Untar the `tau_`*`version`*`.tar.gz` file in a convenient place.

3. Next, configure TAU with **`./configure` *`options`***. You can specify an installation prefix with the `-prefix=`*`TAU_ROOT`* option (the default is use the directory in which you *build* TAU). There are many other configuration options available (type **`./configure -help`** for a complete list).

Note

In these exercises, MPI is not needed, but if you want to build TAU with it, you'll need to use the `-mpiinc` and `-mpilib` options. Also, for these exercises, TAU does *not* need to be compiled with Fortran support. Fortran support would be required to work with Fortran code you directly instrument. In these exercises, you will be using TAU via a the TAU performance component, which is written in C++.

4. Build TAU using **`make install`**

5. Untar the `performance-`*`version`*`.tar.gz` file someplace convenient to build.

6. Configure the performance component using **`./configure -ccafe=`*`CCA_TOOLS_ROOT`*` -taumakefile=`*`TAU_ROOT`*`/include/Makefile -without-classic -without-proxygen -ccatk=`*`TAU_CMPT_ROOT`*. *`CCA_TOOLS_ROOT`* and *`TAU_ROOT`* are the installation roots for the CCA tools and TAU that you specified in previous steps. *`TAU_CMPT_ROOT`* is the directory into which you want the performance component tools installed.

7. Build the performance component using **`make ; make install`**

B.4. Setting Up Your Login Environment

Once the CCA tools (and TAU, if needed) have been built, you will need to setup your login environment so that the appropriate commands are added to your execution path, and libraries are added to your `LD_LIBRARY_PATH`.

Wherever you installed the tools above, we will use the following notation in this section:

`CCA_TOOLS_ROOT`	The *fully qualified* path to where the CCA tools were installed (the `--prefix` directory, or the default `./local` expanded to be complete paths, rather than relative)
`TAU_ROOT`	The *fully qualified* path to TAU's install directory (the `-prefix` directory)
`TAU_CMPT_ROOT`	The *fully qualified* path to the TAU performance component (the `-ccatk` directory).

Then the following commands should work, depending on which shell you use:

csh, tcsh and Related Shells.

```
set path=(CCA_TOOLS_ROOT/bin TAU_ROOT \
          TAU_CMPT_ROOT $path)
setenv LD_LIBRARY_PATH CCA_TOOLS_ROOT/lib:$LD_LIBRARY_PATH
```

bash, ksh, sh and Related Shells.

```
export PATH=CCA_TOOLS_ROOT/bin:TAU_ROOT:TAU_CMPT_ROOT:$PATH
export LD_LIBRARY_PATH=CCA_TOOLS_ROOT/lib:$LD_LIBRARY_PATH
```

These commands could be added to your own login files (`$HOME/.cshrc` or `$HOME/.profile`), put in a file somewhere else and sourced in your login files (this is the approach we use in the organized tutorials), or, if appropriate, added to the system login setup by your system administrator.

Tip

If you're a participant in an organized tutorial, we've already prepared a login file with these commands, and others needed for the tutorial, which you simply source in your login file. Specific instructions on how to set this up should have been provided to you along with your tutorial account information.

If you are using Python, you also need to set your `PYTHONPATH` environment variable to include the locations of Python modules associated with the CCA tools and the tutorial itself.

csh, tcsh and Related Shells.

```
setenv PYTHONPATH CCA_TOOLS_ROOT/lib/python2.3/site-packages/:\
tutorial-src/ports/lib/python:\
tutorial-src/components/lib/python
```

bash, ksh, sh and Related Shells.

```
export
PYTHONPATH=CCA_TOOLS_ROOT/lib/python2.3/site-packages/:\
tutorial-src/ports/lib/python:\
tutorial-src/components/lib/python
```

Unfortunately, because of the way Python works, you will have to modify the `PYTHONPATH` any time you add new Python components to your application.

Appendix C. Building the Tutorial and Student Code Trees

$Revision: 1.6 $
$Date: 2004/11/07 15:51:29 $

The code for the tutorial itself comes in two forms, with pointers to both at http://www.cca-forum.org/tutorials/#sources. The file `tutorial-src-`*`version`*`.tar.gz` is the complete package, which has the full code for all of the components created in this Guide as well as a number of others. The file `student-src-`*`version`*`.tar.gz` is a stripped-down version of the tutorial code, from which we've removed all of the components created in working through this Guide.

Note

At the time this particular version of the Hands-On Guide was generated, the *`version`* was 0.2.0_rc1. If there's a more recent version available, you should probably use it, but you should also look for a more current version of this Guide to go with it.

In order to give you a richer set of components to play with initially, we use the `tutorial-src` tree in Chapter 2, *Assembling and Running a CCA Application*, and the `student-src` tree for the remaining exercises. Throughout, the `tutorial-src` tree can be used as a reference, so see how things *should* look when you complete the exercises.

If you're participating in an organized tutorial, we will have built the `tutorial-src` tree for you in advance in a common location, whereas if you're working through these exercises on your own, you'll need to build it yourself. In both cases, you'll need to build your own copy of the `student-src` tree to work in. The procedure for both is nearly identical, and unless otherwise indicated, we will use *`tutorial-src`* to indicate *either* `tutorial-src` or `student-src`.

Tip

Make sure you've setup your login environment per Section B.4, “Setting Up Your Login Environment”. To complete the procedures in this section, you will need to have Babel and Ccaffeine in your execution path, and your `LD_LIBRARY_PATH`.

1. Download the file(s) you need from the location above. (If you're participating in an organized tutorial, the `student-src` tar file will already be on the system system, in the location indicated in your account information handout.)

2. Untar the file in a convenient place with **`tar zxf tutorial-src-`*`version`*`.tar.gz`**. When it completes, change directories into the new code tree.

3. The code tree includes components written in C, C++, F90, and Python. You may need to configure the code tree according to the languages you have available (dependent on how the CCA tools were built in Appendix B, *Building the CCA Tools and TAU, and Setting Up Your Environment*). Run **`./configure --with-languages="`*`f90 c c++ python`*`"`** using the appropriate space-separated list of languages for your environment. The default is to include the languages for which Babel was configured when the CCA tools were installed (see Appendix B, *Building the CCA Tools and TAU, and Setting Up Your Environment*).

4. Once the tree is configured, type **`make`** to build it. This step may take several minutes. When it completes, you should see this message:

```
################ Finished building everything #################
####### You can run some simple tests with 'make check' #######
```

If the build terminates with an error message instead, please ask for assistance.

5. Once the build is complete, you can type **`make check`** to perform a basic check that the component have been built correctly. This is a convenience of the `Makefile` system we've put together for the tutorial that tries to instantiate each component within the Ccaffeine framework. This provides a basic check that the software you've built are "well-formed" CCA components. You should see a message like this, along with a couple of lines of output from **make** itself:

```
#### Testing component instantiation.

====
==== Simple tests passed, all built components were successfully \
     instantiated.
====

#### Testing component connection and execution.

====
==== All simple run tests passed, go command executed successfully.
====
```

Note that the *second test* ("Testing component connection and execution" is expected to *fail* at this stage when building the `student-src` tree because the component you're going to write in these exercises are missing. Both tests should succeed for the `tutorial-src` tree.
